Introduction

Goal

THE PURPOSE OF THIS DOCUMENT IS TO PROVIDE AN OVERVIEW on possible Subledger Accounting setup for Fusion Fixed Assets. We will discuss various scenarios and explain the necessary setup steps.

What is Subledger Accounting (SLA)?

Subledger Accounting (SLA) is a rule-based accounting engine that centralizes accounting for Oracle Fusion products. Subledger Accounting is not a separate product in itself, but is Oracle's engine catering to the accounting needs of both Oracle and external modules. Together with the ledger support, Subledger Accounting enables support of multiple accounting requirements concurrently in a single instance. Different accounting regulations can be satisfied by maintaining and applying different sets of rules to different sets of transactions, or accounting for the same transaction with multiple methods. Subledger accounting options define how journal entries are generated from subledger transactions at the subledger application level.

Definitions

Account Rules (AR)

These are the rules that determine from where an accounting flexfield value is taken or how it is derived. Oracle does provide seeded rules, however one can create one's own rules to derive accounting flexfield segment values. The following rule types are available: Account combination, Segment, and Value Set.

The screenshot shows the 'Account Rule' configuration window. The 'Name' is 'Category Cost Clearing Account', 'Short Name' is 'FA_CAT_COST_CLEARING', and 'Description' is 'Seeded account rule for the category cost clearing account.' The 'Rule Type' is 'Account combination'. Below this, the 'Rules' section is expanded, showing a table with two rules:

Prior	* Value Type	* Value
1	Source	Payables Code Combination Identifier
2	Source	Default Code Combination Identifier

Below the table, 'Rule 2: Conditions' is expanded, showing the condition: '"Payables Code Combination Identifier", "All" Is null'.

Journal Line Rules (JLR)

These are the rules that determine whether a subledger journal line will be a debit or a credit line, whether lines with the same account should be merged and what the accounting class of the line is. The Link Journal Lines option determines whether the journal line rule is set up to establish a link between the accounting of transactions that are related both within the same application, and across applications. In the seeded definition, no link is established.

The screenshot shows the 'Journal Line Rule' configuration window. The 'Name' is 'Addition Cost', 'Short Name' is 'FA_ADD_COST', and 'Description' is 'Cost for addition.' The 'Event Class' is 'Addition' and 'Side' is 'Debit'. The 'Accounting Class' is 'Asset' and 'Switch Debit and Credit' is checked. The 'Merge Matching Lines' option is set to 'No'. The 'Subledger Application' is 'Assets' and 'Status' is 'Active'. Below this, the 'Conditions' tab is selected, showing the condition: '"Adjustment Type" = COST'.

Description Rules (DR)

These are the rules that determine what appears on the subledger journal entry at the header and/or the line. The definition determines both the content and sequence in which the elements of the description appear.

Description Rule

Name	Addition Cost	Subledger Application	Assets
Short Name	FA_ADDITION_COST	Status	Active
Description	Journal entry line description for addition cost.	Created By	Orade
		Creation Date	12/6/10
		Last Updated By	Orade
		Last Update Date	5/10/11

Rules

View     

Priority	Description Details
1	Addition cost for book: "Book Type Code", asset period: "Period Name", for asset number: "Asset Number", transaction number: "Transaction Header Identifier"

Rule 1: Conditions

No conditions found.

Event

Events are used to process transactions, i.e. the transaction drives the accounting event. E.g. the SLA setup for the transaction Addition, e.g. is built under the event Addition and the event CIP Addition. There are also non-accountable events, like an amortized life change where no subledger journal entry is created from the event.

Subledger Journal Entry Rule Sets (SJERS)

The component rules (Account Rules, Journal Line Rules, Description Rules, and Supporting References) are now combined under the Subledger Journal Entry Rule Sets to form the complete set of rules per accounting event for the subledger. This summary of the set of rules needs to be validated before it can be linked to the Accounting Methods for the subledger. The Subledger Journal Entry Rule Set can be assigned only to a Subledger Accounting Method with the same chart of accounts.

Accounting Method

The Accounting Method is the list of Subledger Journal Entry Rule Sets per subledger that can then be linked to the ledger. Only one Subledger Journal Entry Rule Set can be assigned to a Accounting Method with the same chart of accounts.

Ledger

The Ledger is what used to be called the General Ledger Set of Books. It consists of the currency, chart of accounts, accounting calendar, ledger processing options and subledger accounting method.

Fusion Assets vs. EBS R12 Assets

Fusion	EBS
Accounting Methods (AM)	Subledger Accounting Method (SLAM)
Subledger Journal Entry Rule Sets (SJERS)	Application Accounting Definition (AAD) with Journal Line Definition (JLD) *
Journal Line Rules (JLR)	Journal Line Type (JLT)
Account Rules (AR)	Account Derivation Rules (ADR)

Description Rules (DR)	Journal Entry Description (JED)
------------------------	---------------------------------

* AADs are obsolete. One links the Subledger Journal Entry Rule Sets (JLD's) directly to the Accounting Method.

General Overview of the setup steps

What are the setup steps that need to be made in FA?

The very first step is to design the setup. This is best done via a spreadsheet listing the accounting flexfield segment in columns and the different transactions and the accounts needed for them in rows. Then one would determine for each segment for each account needed when creating journals for a transaction where the segment values should be taken or derived from. This task should be performed before the first asset is added to the system.

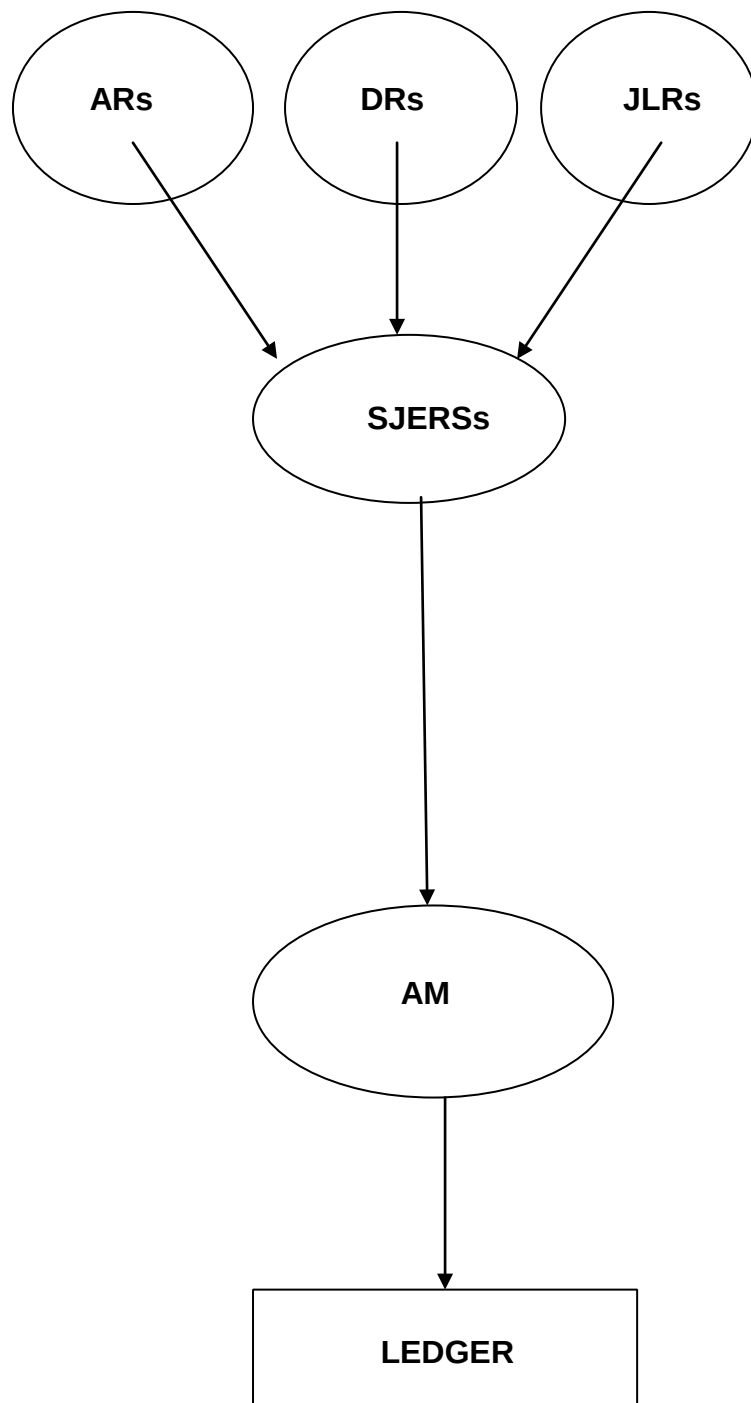

The journal schema per transaction is pretty much fixed in Fixed Assets. So even though one can alter the Description Rules and also create Journal Rules and this may be necessary for other subledgers, in Fixed Assets we do start with the Account Rules. We will also concentrate on them throughout this document.

Once the necessary Account Rules are set up, then the Subledger Journal Entry Rule Sets need to be set up, determining which Account Rule is needed per account for an event. Note: It can be a mixture of seeded Account Rules as well as newly created ones and not every event needs to be customized if the seeded setup covers the requirement.

The Subledger Journal Entry Rule Set is then linked with the Accounting Method, which in turn is then assigned to the Ledger.

Note: The Subledger Accounting setup is valid for ALL depreciation books belonging to the ledger that is linked.

The setup approach we are displaying here is 'from the bottom up', i.e. starting with the lowest level element until the elements are linked together validated and assigned to a ledger. However, one can also start from the top down with the Accounting Method until the Account Rules. In that case one needs to make sure that in the end the Accounting Method is linked to the ledger. The flow of the setup steps can be seen in the diagram below:

Subledger Accounting Setup

What does the default setup look like that Oracle Fusion Assets uses to generate accounting?

Oracle does provide a default setup for subledger accounting. If that default setup satisfies the requirements, then no further setup needs to be made.

Note: However, if some changes have to be made, then they should be made **before** an asset is entered in the system as changes take effect as soon as they are validated and therefore no 'dummy' transaction can be performed to move the balances to the new accounts. This would have to be done via a manual adjusting journal in GL.

The seeded SLA setup for Oracle Fusion Assets

The seeded SLA setup for Oracle Fusion Assets takes the balancing segment value from the Expense Account combination entered in the Assignments region when adding an asset, the natural account segment value from the Manage Asset Category or Manage Asset Book page – depending on the account – and all other segment values from the Account Default combination in the Manage Asset Book page under the Accounts region.

Columns Hidden: 22 Columns Frozen: 4

Example

How does the Depreciation Reserve Account get derived via the seeded Subledger Accounting setup for an Accounting Flexfield consisting of the following 3 segments: Company-Cost Center-Account :

Asset Book Account Default combination	01-000-1000
Category – Depreciation Reserve Account	01-100-2000
Expense Account- Assignment	02-200-3000

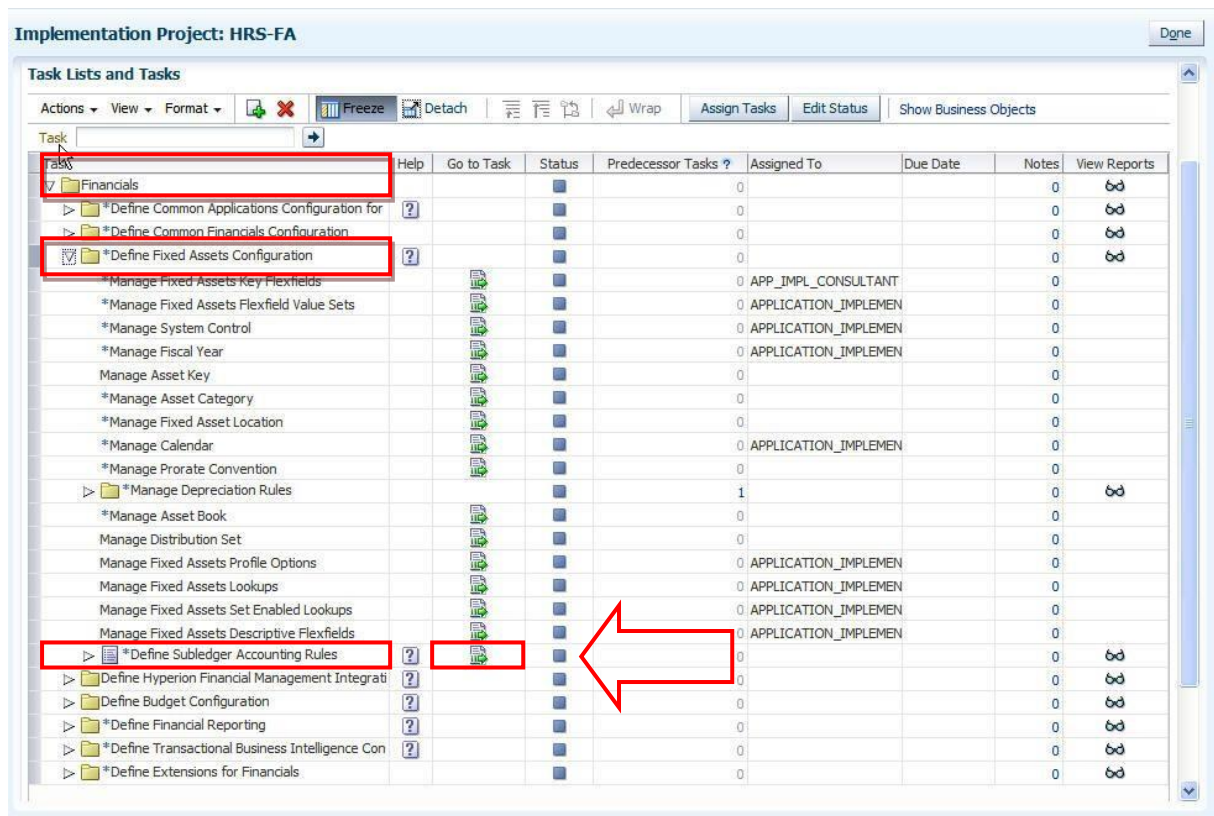

Company	Company Segment from Expense Account - Assignment	02
Cost Center	Cost Center from Manage Asset Book Account Default Account	000
Account	Account value from Account Segment – From the Manage Asset Category page 2000	

The Depreciation Reserve Account will be created with: 02-000-2000.

Navigation in the Functional Setup Manager (FSM)

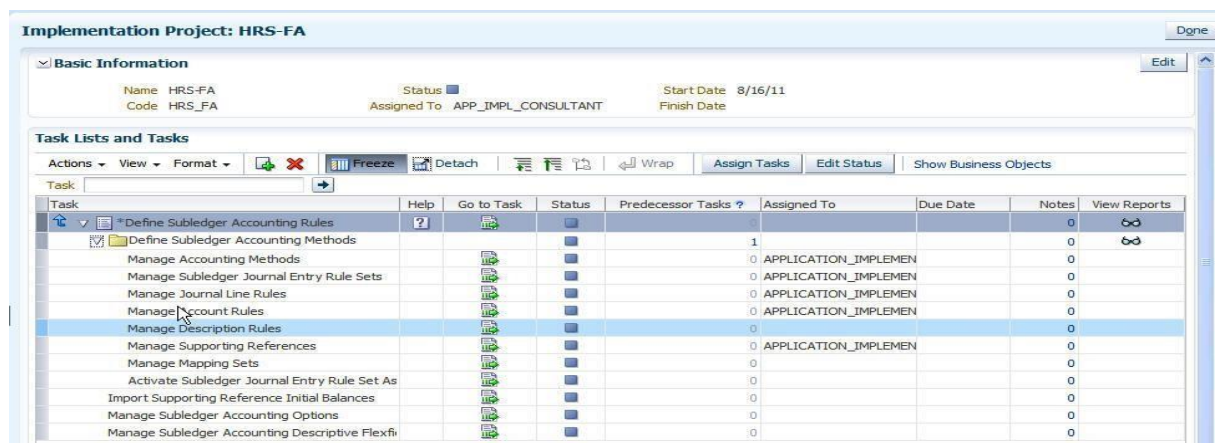

All setup tasks in Oracle Fusion Applications are performed in the Functional Setup Manager (FSM). For further information on the FSM itself, please refer to Documentation Available Related with Functional Setup Manager (FSM) (Doc ID 1335563.1) and Primary Note on Functional Setup Manager (FSM) (Doc ID 1004.1).

The best way to start with the setup of Subledger Accounting for Assets is to create an Implementation Project either for Financials, which will then include Assets or for Assets alone via task Manage Implementation Projects.

Define Subledger Accounting Rules for Fusion Assets is a subset of the seeded Define Fixed Assets Configuration task list.

Note: By clicking on the Go to Task button for the Define Subledger Accounting Rules row, the subset of tasks opens and the Fixed Assets context is chosen. It is therefore important to perform this step in order to be able to perform the Subledger Accounting setup steps for Fusion Assets.

Subledger Accounting Customization – Account Rules

The way the SLA setup forms have been designed make alterations easy as one can query a seeded definition and copy it and then make the changes in the copy. The only page where that may not always be the quickest way is the Account Rules form.

To copy/duplicate a component definition, use the copy icon  or Actions > Duplicate.

We will not discuss the use of Mapping Sets here as there is currently no Lookup Type seeded for application Assets. We will also not look into custom sources.

We are, however, discussing six common setup cases below.

Note: Make sure that a clear and logical syntax for the naming convention is used so that one can quickly see the purpose of a definition.

Case 1: Cost Center value from Expense Account (seeded as: FA_EXPENSE_ACCT_COST_CTR_SEG_PAY)

The screenshot shows the 'Account Rule' configuration window. The 'Name' is 'Asset Expense Account Cost Center Segment with Payables Check'. The 'Short Name' is 'FA_EXP_ACCT_COST_CTR_SEG_PAY'. The 'Description' is 'Seeded account rule for the asset expense account cost center segment with payables'. The 'Rule Type' is 'Segment' and 'Cost Center Segment'. The 'Subledger Application' is 'Assets', 'Status' is 'Active', and 'Created By' is 'Oracle'. The 'Rules' section shows a table with one rule: '1 Source Expense Account Code Combination Identifier'. The 'Rule 1: Conditions' section shows 'No conditions found.'

Prior	* Value Type	* Value
1	Source	Expense Account Code Combination Identifier

The accounting flexfield needs to be picked if the Account Rule is to be on a rule for segments that do not have a flexfield segment label and if no constant value is to be used. As the cost center segment does have a segment label and we do not want to use a constant value here, it is not necessary to assign an accounting flexfield to the rule. The rule type is therefore segment and the segment chosen is the Cost Center Segment. The Expense Account Code Combination Identifier is the complete account code combination for the expense account of the Assignment region when adding an asset manually or via a source line.

As this rule is seeded, we do not need to define it and can use it later on when creating the Subledger Journal Entry Rule Sets.

Case 2: 'Accounting Flexfield segment without a segment label' value from the code combination in the Manage Asset Category page (Account CCID)

Edit Account Rule

* Name: HR_PROD_FROM_RSV_CCID
Short Name: HR_PROD_FROM_RSV_CCID
Description: Product Segment value from the Reserve Account in Manage Asset Categories
Chart of Accounts: Germany Accounting File
Rule Type: Segment
Product

Rules
Reorder rules to change priority.
Actions View Format + - [icon] [icon] [icon] [icon] [icon] Wrap

Prior	* Value Type	* Value
1	Source	Reserve Account Code Combination Identifier

Rule 1: Conditions
Enter a constant value and source directly, or select a source.
Insert Source () AND OR Operator

No conditions found.

Validate

1. Navigation: Manage Account Rules
2. Give your Account Rule a short name, a description, and a meaningful name.
3. The accounting flexfield needs to be picked if the Account Rule is to be on a rule for segments that do not have a flexfield segment label and if no constant value is to be used. As the product segment does not have a segment label, it is necessary to assign an accounting flexfield to the rule. The rule type is segment and the segment chosen is the Product Segment. This segment will only be available in the pick list if the appropriate accounting flexfield is chosen.
4. In the Rules region of the form insert a new row and assign a priority. The Value Type is Source and the Value is Reserve Account Code Combination Identifier for the Segment Product. The Reserve Account Code Combination ID is the complete account code combination for the reserve account in the Manage Asset Category page.
5. No Condition is necessary here.
6. Save. This Account Rule is later used when creating the Subledger Journal Entry Rule Sets.

If one would want to use the complete account combination from an account in the Manage Asset Category page, then the Account Rule would have to be set up like in the following example, where the complete reserve account combination would be taken as set up in the Manage Asset Category page.

Create Account Rule

* Name: HR Reserve Account Combination from f
 * Short Name: HR_RSV_ACCOUNT_CCID
 Description: HR Reserve Account Combination from the Manage Asset Category page
 Chart of Accounts:
 Rule Type: Account combination

Rules
 Reorder rules to change priority.

Prior	* Value Type	* Value
1	Source	Reserve Account Code Combination Identifier

Rule 1: Conditions
 Enter a constant value and source directly, or select a source.
 Insert Source () AND OR Operator
 No conditions found.
 Validate

Note that the source used is the same as for the Account Rule above with the rule type Segment.

Case 3: A constant value for an 'Accounting Flexfield segment without a segment label'

Edit Account Rule

* Name: HR Constant Product value 150
 Short Name: HR_PRODUCT_CONSTANT_150
 Description: Constant value 150 for segment Product
 Chart of Accounts: Germany Accounting File
 Rule Type: Segment
 Product

Rules
 Reorder rules to change priority.
 Actions View Format + - Copy Paste Up Down Wrap

Prior	* Value Type	* Value
1	Constant	150

Rule 1: Conditions
 Enter a constant value and source directly, or select a source.
 Insert Source () AND OR Operator
 No conditions found.
 Validate

1. Navigation: Manage Account Rules

2. Give your Account Rule a short name, a description, and a meaningful name.
3. The accounting flexfield needs to be picked if the Account Rule is to be on a rule for segments that do not have a flexfield segment label or if a constant value is to be chosen. As the product segment does not have a segment label and we do intend to use a constant value, it is necessary to assign an accounting flexfield to the rule. The rule type is segment and the segment chosen is the Product Segment. This segment will only be available in the pick list if the appropriate accounting flexfield is chosen.
4. In the Rules region of the form insert a new row and assign a priority. The Value Type is Constant and the Value is 150, which is a valid segment value for this segment.
5. No Condition is necessary here.
6. Save. This Account Rule is later used when creating the Subledger Journal Entry Rule Sets.

Case 4: Cost Center value from several different locations depending on the Retirement Type

Option 1:

Edit Account Rule

* Name: HR NBV Cost Center depending on Retir
Short Name: HR_NBV_CC_FROM_RET_TYPE
Description: Take the Cost Center for the NBV retired account depending on the retirement type.

Chart of Accounts: Germany Accounting Fle
Rule Type: Segment
Cost Centre

Rules

Reorder rules to change priority.

Actions View Format + X [icon] [icon] [icon] [icon] [icon] [icon] Wrap

Prior	* Value Type	* Value
1	Constant	402
2	Account rule	Asset Expense Account Cost Center Segment with Payables Check
3	Source	Default Code Combination Identifier
4	Source	Depreciation Expense Code Combination Identifier

Rule 4: Conditions

Enter a constant value and source directly, or select a source.

Insert Source () AND OR Operator

"Retirement Type" = SALE

Validate

We will now also introduce conditions. With this example we want to show not only the conditions, but also the various 'locations' a segment value can be taken/derived from. We will use a constant value, the expense account from the Assignments window and also from the Manage Asset Categories from as well as the Default combination from the Manage Asset Book window.

1. Navigation: Manage Account Rules
2. Give your Account Rule a short name, a description, and a meaningful name.
3. The accounting flexfield needs to be picked if the Account Rule is to be on a rule for segments that do not have a flexfield segment label or if a constant value is to be chosen. As the Cost Center segment does have a segment label but we do intend to use a constant value, it is not necessary to assign an accounting flexfield to the rule. The rule type is segment and the segment chosen is the Cost Center Segment. This segment will only be available in the pick list if the appropriate accounting flexfield is chosen.
4. In the Rules region of the form insert a new row and assign a priority. The Value Type is Constant and the value is 402, which is a valid segment value for this segment.
5. In the Condition region pick the source Retirement Type, the operator =, and the value THEFT. The system will set the quotes on the source when saving the record.
6. In the Rules region of the form insert a new row and assign a priority. The Value Type is Account

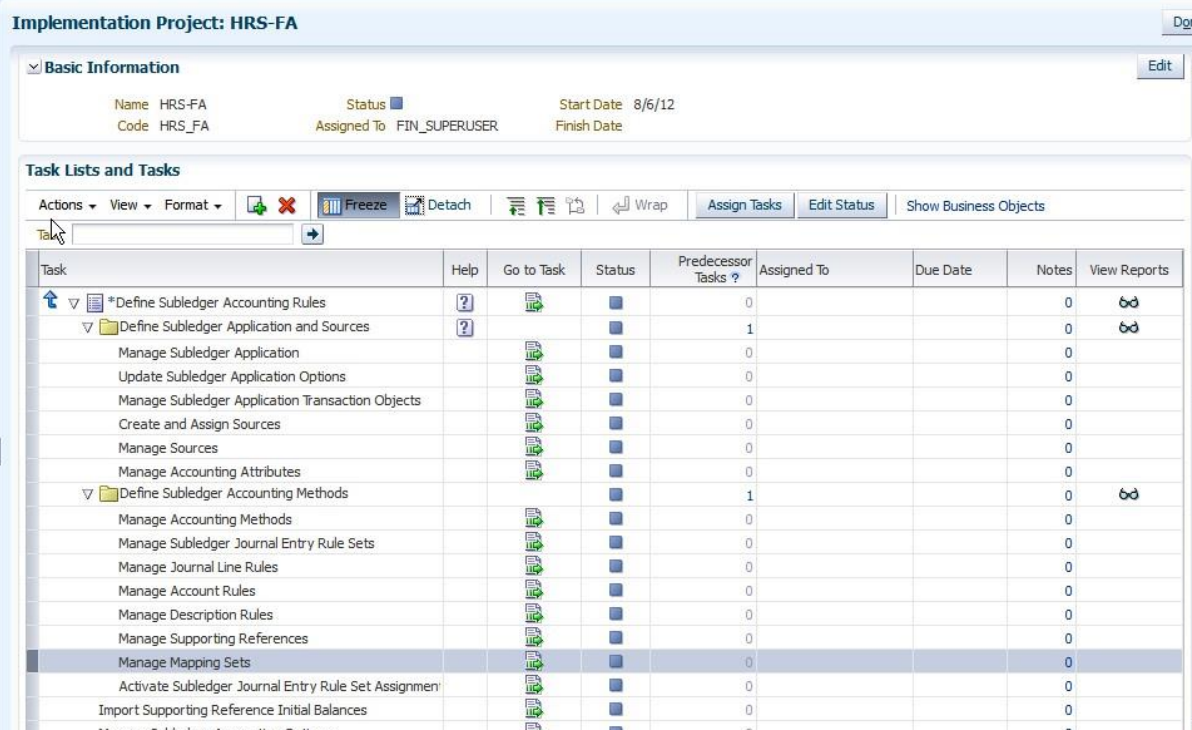

Rule and the Value is Asset Expense Account Cost Center Segment with Payables Check for the Segment Cost Center Segment. The Expense Account Code Combination Identifier is the complete account code combination for the expense account in the Assignments region when adding an asset.

7. In the Condition region pick the source Retirement Type, the operator =, and the value CASUALTY. The system will set the quotes on the source when saving the record.
8. In the Rules region of the form insert a new row and assign a priority. The Value Type is Source and the Value is Default Code Combination Identifier for the Segment Cost Center Segment. The Default Code Combination Identifier is the complete account code combination for the Account Default account in the Manage Asset Book page.
9. In the Condition region pick the source Retirement Type, the operator =, and the value EXTRAORDINARY. The system will set the quotes on the source when saving the record.
10. In the Rules region of the form insert a new row and assign a priority. The Value Type is Source and the Value is Depreciation Expense Code Combination Identifier for the Segment Cost Center Segment. The Depreciation Expense Code Combination Identifier is the complete account code combination for the Expense account in the Manage Asset Category page.
11. In the Condition region pick the source Retirement Type, the operator =, and the value SALE. The system will set the quotes on the source when saving the record.
12. Save. This Account Rule is later used when creating the Subledger Journal Entry Rule Sets.

Option 2: Natural Account depending on Retirement Type

Alternatively, this can be set up via a Mapping Set as follows:

1. Navigation: Manage Mapping Sets

Task	Help	Go to Task	Status	Predecessor Tasks ?	Assigned To	Due Date	Notes	View Reports
*Define Subledger Accounting Rules	?			0			0	
Define Subledger Application and Sources	?			1			0	
Manage Subledger Application				0			0	
Update Subledger Application Options				0			0	
Manage Subledger Application Transaction Objects				0			0	
Create and Assign Sources				0			0	
Manage Sources				0			0	
Manage Accounting Attributes				0			0	
Define Subledger Accounting Methods				1			0	
Manage Accounting Methods				0			0	
Manage Subledger Journal Entry Rule Sets				0			0	
Manage Journal Line Rules				0			0	
Manage Account Rules				0			0	
Manage Description Rules				0			0	
Manage Supporting References				0			0	
Manage Mapping Sets				0			0	
Activate Subledger Journal Entry Rule Set Assignment				0			0	
Import Supporting Reference Initial Balances				0			0	
Manage Subledger Accounting Options				0			0	

2. Give your Account Rule a short name, a description, and a meaningful name. For Output Type, pick Segment.

Create Mapping Set ? Save Save and Close Save and Create Another Cancel

* Name: HR_RET_TYPE
 * Short Name: HR_RET_TYPE
 * Output Type: Segment
 Subledger Application: Assets
 Description: NRV Accounts depending on Retirement Type lookup

Reorder rules to change priority.

Actions View Format + X [Icon] [Up Arrow] [Down Arrow] Wrap

Prior	* Value Type	* Value
1	Mapping set	HR_RET_TYPE
2	Source	NBV Gain Account

Rule 2: Conditions

Enter a constant value and source directly, or select a source.

Insert Source () AND OR Operator

"Retirement Type" is null

Validate

1. Navigation: Manage Account Rules
2. Give your Account Rule a short name, a description, and a meaningful name.
3. The accounting flexfield needs to be picked as well as the Rule Type Segment, as it was required for the Mapping Set.
4. In the Rules region of the form insert a new row and assign a priority. Choose Value Type Mapping set and pick the Mapping Set we have just set up. No condition is necessary. Add a new row and assign a priority. The Value Type is Source and the Value is Net Book Value Retired Gain Account, which is the NBV Gain Account set up in the Manage Asset Book page.
5. In the Condition window assign a priority. Pick the source Retirement Type, the operator Is NULL. Save.

Optionally, set up a new ADR for the Book Value Retired Gain Account and repeat the same.

Case 5: Segment Value derived from a Descriptive Flexfield Value

There are 2 ways of setting up an Account Rule to derive an accounting flexfield value from a descriptive flexfield value.

Create Account Rule

* Name: HR Product Segment Value from DFF

* Short Name: HR_DFF_PRODUCT

Description: Product Segment Value from Descriptive Flexfield

Chart of Accounts: Germany Accounting Fle

Rule Type: Segment

Product

Rules

Reorder rules to change priority.

Actions View Format + X [Icons] [Up/Down] [Wrap]

Prior	* Value Type	* Value
1	Constant	100
2	Constant	110
3	Constant	130
4	Constant	200

Rule 4: Conditions

Enter a constant value and source directly, or select a source.

Insert Source () AND OR Operator

("Asset Category Attribute 10" = ADDITION) 'AND' ("Asset Category Attribute 11" = 100)

Validate

Option 1:

The requirement here was to take a different segment value depending on the value entered in a descriptive flexfield in case of an asset addition. The setup done prior to defining this Account Rule was to set up the Asset Category Descriptive Flexfield. Behind ATTRIBUTE10 is a value set containing values ADDITION and behind ATTRIBUTE11 is a value set containing some values also used for the Product segment.

1. Navigation: Manage Account Rules
2. Give your Account Rule a short name, a description, and a meaningful name.
3. The accounting flexfield needs to be picked if the Account Rule is to be on a rule for segments that do not have a flexfield segment label or if a constant value is to be chosen. As the product segment does not have a segment label and we do intend to use a constant value, it is necessary to assign

an accounting flexfield to the rule. The rule type is segment and the segment chosen is the Product Segment. This segment will only be available in the pick list if the appropriate accounting flexfield is chosen.

4. In the Rules region of the form insert a new row and assign a priority. The Value Type is Constant and the Value is 100, which is a valid segment value for this segment.
5. In the Condition region pick the source Asset Category Attribute10, the operator = and the value ADDITION. The system will set the quotes on the source when saving the record. Chose AND, pick the source Asset Category Attribute11, the operator = and the value 100.
6. In the Rules region of the form insert a new row and assign a priority. The Value Type is Constant and the Value is 110, which is a valid segment value for this segment.
7. In the Condition region pick the source Asset Category Attribute10, the operator = and the value ADDITION. The system will set the quotes on the source when saving the record. Chose AND, pick the source Asset Category Attribute11, the operator = and the value 110.
8. Continue steps 4./5., i.e. 6./7. until all valid values and their conditions are set up. There is currently no possibility to handle this differently as there is no validation for the correlation of the segment values with the entered descriptive flexfield values.
9. Save. This Account Rule is later used when creating the Subledger Journal Entry Rule Sets.

Option 2:

Covering the same requirement, we are using the same descriptive flexfield setup.

Create Account Rule

* Name: HR DFF from Value Set
 * Short Name: HR_DFF_PV_PROD
 Description: Product Segment Value derived from a DFF value set.
 Rule Type: Value set
 Operations Product: Operations Product

Rules
 Reorder rules to change priority.
 Actions View Format + - Copy Paste Up Down Wrap

Prior	* Value Type	* Value
1	Source	Asset Category Attribute 11

Rule 1: Conditions
 Enter a constant value and source directly, or select a source.
 Insert Source () AND OR Operator

("Asset Category Attribute 10" = ADDITION) 'AND' ("Asset Category Attribute 10" is not null)

Validate

1. Navigation: Manage Account Rules

2. Give your Account Rule a short name, a description, and a meaningful name.

3. The accounting flexfield should NOT be picked as instead of Flexfield or Segment, the rule type Value Set is chosen. The value set behind the Product segment of the accounting flexfield is picked.
4. In the Rules region of the form insert a new. The Value Type is Source and the Value is Asset Category Attribute 11, which is the attribute of the descriptive flexfield linked with the Product segment.
5. In the Condition region pick the source Asset Category Attribute10, the operator = and the value ADDITION. The system will set the quotes on the source when saving the record. Chose AND, pick the source Asset Category Attribute11, the operator IS NOT NULL. This means that only a value is used if there is one stored for an asset.
6. Save. This Account Rule can also be used later when creating the Subledger Journal Entry Rule Sets.

Case 6: Natural Account taken from the category for tax books

The seeded expense account definition takes the complete account combination from the Assignments window of the Asset Workbench. If one would want to create standard accounting also for tax books, then the corporate book expense account would be used.

The screenshot shows the 'Create Account Rule' form. The top section contains fields for Name, Short Name, Description, Chart of Accounts, Rule Type, and a dropdown for Natural Account Segment. The 'Rules' section includes a table with columns for Prior, Value Type, and Value. The 'Rule 1: Conditions' section has a text area for conditions and a 'Validate' button.

Create Account Rule

* Name: HR Expense Account for Tax Book
* Short Name: HR_DEPRN_EXP_ACCT_TAX_BOOK
Description: Natural Account segment for the depreciation expense account for the tax book
Chart of Accounts: [Dropdown]
Rule Type: Segment
Natural Account Segment: [Dropdown]

Rules

Reorder rules to change priority.

Actions View Format [Icons] [Wrap]

Prior	* Value Type	* Value
1	Source	Depreciation Expense Code Combination Identifier

Rule 1: Conditions

Enter a constant value and source directly, or select a source.

Insert Source () AND OR Operator [Dropdown]

"Book Type Code" != VISION DE HB

Validate

1. Navigation: Manage Account Rules
 2. Give your Account Rule a short name, a description, and a meaningful name.
 3. The accounting flexfield needs to be picked if the Account Rule is to be on a rule for segments that do not have a flexfield segment label or if a constant value is to be chosen. The natural account segment, in this case, the accounting flexfield does not have to be used as the natural account segment is labeled.
 4. In the Rules region of the form insert a new row and assign a priority. The Value Type is Source and the Value is Depreciation Expense Account Code Combination Identifier, which is the expense account combination from the Manage Asset Category page.
 5. In the Condition region pick the source Book Type Code, the operator != for not equal and the value VISION DE HB as the book type code. If more corporate books exist for the ledger, they would have to be added here as well. The system will set the quotes on the source when saving the record.
- Note:** We have chosen the route over the source Book Type Code as the source Book Class is currently not yet available.
6. Save. This Account Rule is later used when creating the Subledger Journal Entry Rule Sets.

Subledger Accounting Customization – Subledger Journal Entry Rule Sets

Now that we have set up the necessary Account Rules for our 6 cases, we have to set up the Journal Line Rules (JLRs). We are starting with the example of the event Addition, and then we will go on with the example event Retirement and finally recap the steps to set up a Subledger Journal Entry Rule Set SJER.

How to set up a Subledger Journal Entry Rule Set (SJERS) ?

Navigate to Manage Subledger Journal Entry Rule Sets and search for the Addition rule set.

Manage Subledger Journal Entry Rule Sets: Assets

HR Category Change	Category Change	All	HREISSE2	Germany Accounting Flex	Custom Rule Set for Category Change

Click on the Duplicate button or got to Actions > Duplicate. This will open a pop-up window. Enter the Subledger Journal Entry Rule Set Name, Short Name and Description making sure that the chosen name is meaningful. If the Account Rules to be used were set up with a Chart of Accounts, then pick also the same Chart of Accounts for the Subledger Journal Entry Rule Set. Click on Save and close.

This will open the newly copied Subledger Journal Entry Rule Set. Let us take a look:

Note the Status Incomplete. The rule set will be completed/activated at a later step.

Note: **Account Combination Rules** take the complete account code combination from a location. Individual segment values can then be overridden by the **Segment Rules**.

Book Controls Default Account is the default account combination defined in the Manage Asset Book page.

Asset Depreciation Expense Account is the expense account combination in the assignments region when adding or transferring an asset.

Category Cost Clearing Account is the complete account combination of the Asset Clearing account. **Note:** When adding an asset via another subledger, eg Payables, the Asset Clearing account combination entered in the subledger will be used to allow the clearing of that account combination. Manual additions in Assets will use the **Book Controls Default Account** combination. **Note:** The Asset Clearing account combination entered in the subledger cannot be used as a source to derive account code combinations or segment values for any other account.

Edit Subledger Journal Entry Rule Set

Supporting References
No supporting reference to display.

Note: These are the seeded **Journal Line Rules**. An example can be seen in the Definition section of this document. To use a custom Journal Line Rule (JLR), one would add the previously defined custom JLR via the Green Plus button or via Actions > Add Row. The seeded JLR that is replaced by the custom JLR needs to be removed via the Red Cross button or via Actions > Remove.

Note: These are the seeded **Description Rules**. An example can be seen in the Definition section of this document. To use a previously defined custom Description Rule (DR), one needs to click on the drop-down list and choose it.

Supporting references facilitate accounting analysis, reporting and reconciliation by letting you break down subledger balances in totals and subtotals. A supporting reference comprises of one or more pieces of transaction information, each of which can be used to calculate a subtotal or total of the account balance. No Supporting References are seeded for Fusion Assets. To create custom Supporting References use the help article "Creating Supporting References: Explained" available in the Help Portal of the Fusion Application.

How are the custom Account Rules now linked to the SJERS?

Let us now pick the Segment Rules we have set up before. The Addition SJERS we set up as follows:

Edit Subledger Journal Entry Rule Set ?

Actions: [Save] [Save and Create Another] [Save and Close] [Cancel]

* Name: HR Addition

Debit	Addition Reserve Offset for Bonus Expense	Asset	Book Controls Default A	Category Reser			Addition

Account Rule from Case 1: seeded rule Asset Expense Account Cost Center Segment where the cost center value from the expense account combination in the Assignments page is taken.

Account Rule from Case 2: Product Segment value from the Reserve Account code combination in the Manage Asset Category page.

Account Rule from Case 5: Product Segment value from the Descriptive Flexfield where we want to take the Product segment value from the Descriptive Segment Value in case of an asset addition.

Account Rule from Case 6: Natural Account Segment from the expense account combination in the Manage Asset Category page. **Note:** The depreciation catch-up expense for backdated expensed asset additions is included in the Additions journal and NOT in the Depreciation Journal. **Note:** This Account Rule to use the natural account from the Define Categories page for tax books will have to be defined for all events where an expense account line is to be created.

Subledger Accounting Customization – Link with the Ledger

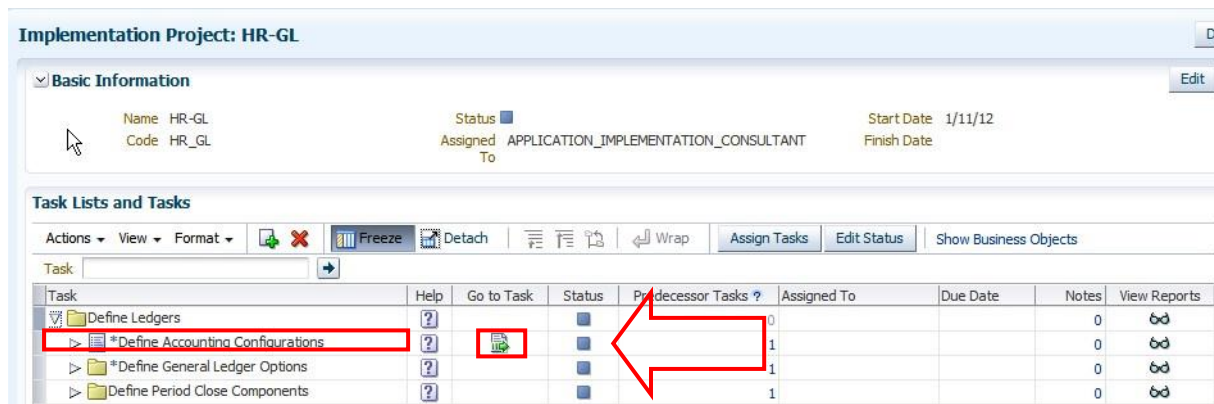

The custom Subledger Accounting Setup is now complete and only the last step now needs to be performed:

How to link the Accounting Method (AM) with the Ledger?

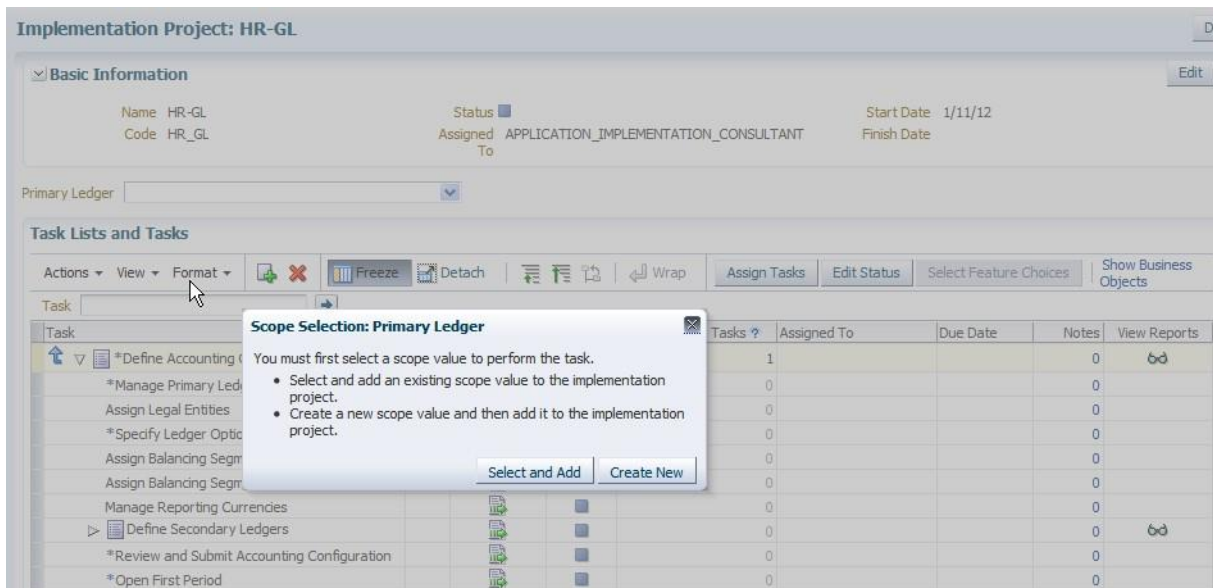

In the FSM, query a Define Ledgers project.

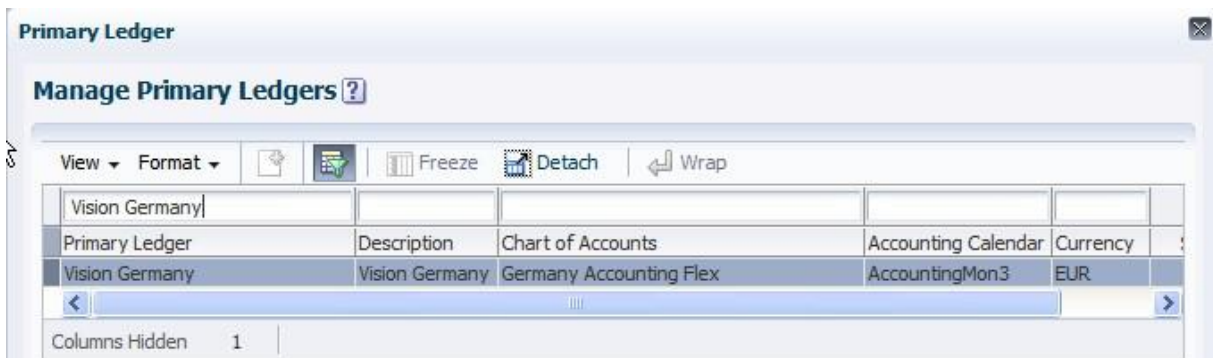

Open the project and click on Go to Task for Define Accounting Configurations.

This will open a pop-up page where one needs to decide whether to select an already existing ledger or to create a new one.

In our case, the ledger exists already, so we choose Select and Add.

We query the Ledger to which the Accounting Method should be attached. Once we have clicked on Save, we get back to our implementation project. Click on Go to Task for Specify Ledger Options.

Intercompany Balancing Rules

The Intercompany Accounts Payable and the Intercompany Accounts Receivable accounts are not found in the Accounts tab of the Manage Asset Book page. Instead, Intercompany Balancing Rules have to be set up. This allows more flexibility as for each journal category; one can decide to use a different intercompany account. Or one can also set up a Chart of Accounts rule which will cover all intercompany transactions for the ledger. We will display now how such a Chart of Accounts rule can be set up.

How to set up the Intercompany Balancing Rules?

1. Navigation: FSM > task Manage Intercompany Balancing Rules
2. Query the Ledger to which the Accounting Method is attached

The screenshot shows the 'Manage Intercompany Balancing Rules' window. The search criteria are set to: Chart of Accounts (empty), * From Ledger (Vision Germany), From Legal Entity (empty), From Primary Segment Value (empty), and Show end-dated rules (checked). The search results are displayed under the 'Chart of Accounts Rules' tab. The results table shows a rule for Germany Accounting (01-9999-000-000) with a start date of 1/11/00 and a source of Other.

Chart of Accounts	Receivables Account	Payables Account	Start Date	End Date	Source
Germany Accounting	01-9999-000-000	01-9999-000-000	1/11/00		Other

Here we can see a rule which is already set up. Pick the Chart of Accounts, the Receivables and the Payables accounts; the source is Other, the journal category is also Other, and the Transaction type is None. Enter a start date and save. This is the simplest way to set up an intercompany rule. For a more elaborate and refined setup, please consult to the documentation on Intercompany.

The screenshot shows the 'Manage Intercompany Balancing Rules' window. The search criteria are set to: Chart of Accounts (empty), * From Ledger (Vision Germany), From Legal Entity (empty), From Primary Segment Value (empty), and Show end-dated rules (checked). The search results are displayed under the 'Chart of Accounts Rules' tab. The results table shows a rule for Germany Accounting (01-9999-000-000) with a start date of 1/11/00 and a source of Other.

Chart of Accounts	Payables Account	Start Date	End Date	Source	Category	Transaction Type
Germany Accounting	01-9999-000-000	1/11/00		Other	Other	None

This is what it looks like in EBS Release 12:

Oracle Applications

Accounting Attribute Group: Entered currency

Entered currency: Accounting Attribute Assignments

Accounting Attribute	Source ?
Entered Amount	Entered Amount
Entered Currency Code	Currency Code

Once the Reconciliation feature is available in Fusion and one is able to create the Journal Line Rules with the Accounting Attribute Reconciliation Reference, one would add the new custom JLR via the Green Plus button or via Actions > Add Row to the Subledger Journal Entry Rule Sets. The seeded JLR that is replaced by the custom JLR needs to be removed via the Red Cross button or via Actions

> Remove from the Subledger Journal Entry Rule Sets. Make sure that the Subledger Journal Entry Rule Set is active. The next time Create Accounting is run in Final mode and the journals are sent to GL, the lines with the Reconciliation Reference will be available for the Reconcile Journal Lines feature.

Testing the Definition

What will the accounts look like based on our setup?

We will now check our definition on a backdated asset addition where we will also see depreciation catch-up expense. The Create Accounting output shows:

Event Class	Addition	Transaction Number	334477
Event Type	Addition	Event Date	Jan 1, 2007
Event Number	1	Book Type Code	HR1
Asset Number	HR-FD-2	Asset Description	Desk
Period Entered	01-07		
Ledger	Vision Germany	Ledger Currency	EUR
		Accounting Date	Jan 1, 2007

Journal Entry Description							
Line	Accounting Class	Account	Entered Currency	Entered Debit	Entered Credit	Accounted Debit	Accounted Credit
1	Asset	01-0410-112-130	EUR	2,400.00		2,400.00	
2	Asset	01-0493-000-000	EUR		2,400.00		2,400.00
3	Asset	01-0420-112-120	EUR		400.00		400.00
4	Expense	01-4831-112-000	EUR	400.00		400.00	
Total for Journal Entry						2,800.00	2,800.00

Line 1 is the asset cost account combination.
 Line 2 is the asset clearing account combination.
 Line 3 is the reserve account combination.

Value 112 is from Case 1 where we want to take the cost center segment value from the expense account combination in the Assignments region.

Value 120 is from Case 2: Product Segment value from the Reserve Account code combination in the Manage Asset Category page.

Value 130 is from Case 5: Product Segment value from the Descriptive Flexfield where we want to take the Product segment value from the Descriptive Segment Value in case of an asset addition.

The expense account is completely that entered as the assignment for the asset because this is the corporate book journal. Now let us look at the same addition event in the tax book.

Journal Entry Description							
Line	Accounting Class	Account	Entered Currency	Entered Debit	Entered Credit	Accounted Debit	Accounted Credit
1	Asset	01-9920-112-130	EUR	2,400.00		2,400.00	
2	Asset	01-9923-000-000	EUR		2,400.00		2,400.00
3	Asset	01-9925-112-120	EUR		240.00		240.00
4	Expense	01-9926-112-000	EUR	240.00		240.00	
Total for Journal Entry						2,640.00	2,640.00

Value 112 is from Case 1 where we want to take the cost center segment value from the expense account combination in the Assignments region.

Value 120 is from Case 2: Product Segment value from the Reserve Account code combination in the Manage Asset Category page.

Value 130 is from Case 5: Product Segment value from the Descriptive Flexfield where we want to take the Product segment value from the Descriptive Segment Value in case of an asset addition.

Natural account value 9926 is from Case 6: Natural account segment of the expense account combination in the Define Categories page for tax books.

To test our setup for a retirement event, we have entered a full retirement transaction and ran Create Accounting in draft mode:

Event Class Retirement		Transaction Number 334489				
Event Type Retirement		Event Date Feb 28, 2007				
Event Number 1		Book Type Code HR1				
Asset Number HR-FD-2		Asset Description Desk				
Period Entered 02-07						
Ledger Vision Germany		Ledger Currency EUR				
		Accounting Date Feb 28, 2007				
Entry Description						
ng	Account	Entered Currency	Entered Debit	Entered Credit	Accounted Debit	Accounted Credit
	01-0420-000-000	EUR		66.67		66.67
	01-4831-112-000	EUR	66.67		66.67	
	01-0420-112-150	EUR	533.34		533.34	
	01-0410-112-150	EUR		2,400.00		2,400.00
	01-2310-402-150	EUR	1,866.66		1,866.66	
Total for Journal Entry					2,466.67	2,466.67

Line 1 is the Retirement Catch-Up Reserve account offsetting the Retirement Expense. We have not customized this account.

Line 2 is the Retirement Expense account.

Line 3 is the Retirement Reserve account.

Line 4 is the Retirement Cost account.

Line 5 is the NBV Retired account.

Value 112 is from Case 1 where we want to take the cost center segment value from the expense account combination in the Assignments region.

Value 402 is from Case 4 where we take the Cost Center segment value depending on the Retirement Type.

Value 150 is from Case 3 where we take constant value 150 for the Product segment.

After mass copying the transaction to the tax book and running Create Accounting in draft mode for the tax book we can see that we are getting the following journal entry for the same retirement:

Event Class Retirement
 Event Type Retirement
 Event Number 1
 Asset Number HR-FD-2
 Period Entered 02-07

Transaction Number 334491
 Event Date Feb 28, 2007
 Book Type Code TAXHR1
 Asset Description Desk

Ledger Vision Germany

Ledger Currency EUR

Accounting Date Feb 28, 2007

Journal Entry Description

Line	Accounting Class	Account	Entered Currency	Entered Debit	Entered Credit	Accounted Debit	Accounted Credit
1	Asset	01-9925-000-000	EUR				
2	Expense	01-9926-112-000	EUR	40.00	40.00	40.00	40.00
3	Asset	01-9925-112-150	EUR	320.00		320.00	
4	Asset	01-9920-112-150	EUR		2,400.00		2,400.00
5	Asset	01-2310-402-150	EUR	2,080.00		2,080.00	
Total for Journal Entry						2,440.00	2,440.00

Value 112 is from Case 1 where we want to take the cost center segment value from the expense account combination in the Assignments region.

Value 402 is from Case 4 where we take the Cost Center segment value depending on the Retirement Type.

Value 150 is from Case 3 where we take constant value 150 for the Product segment.

Natural account value 9926 is from Case 6: Natural account segment of the expense account combination in the Define Categories page for tax books.

After having entered all event triggering transactions, one can run Create Accounting in Draft mode with report style Detail, review the result, make necessary changes and run Create Accounting in Draft mode again until the SLA setup for Fusion Assets is completely as intended.

Note: Every time a component in the SLA setup is updated or altered, the Activate Subledger Journal Entry Sets Assignments job needs to be run again before Create Accounting can be resubmitted.

How to transfer the SLA Setup for Fusion Assets to another instance?

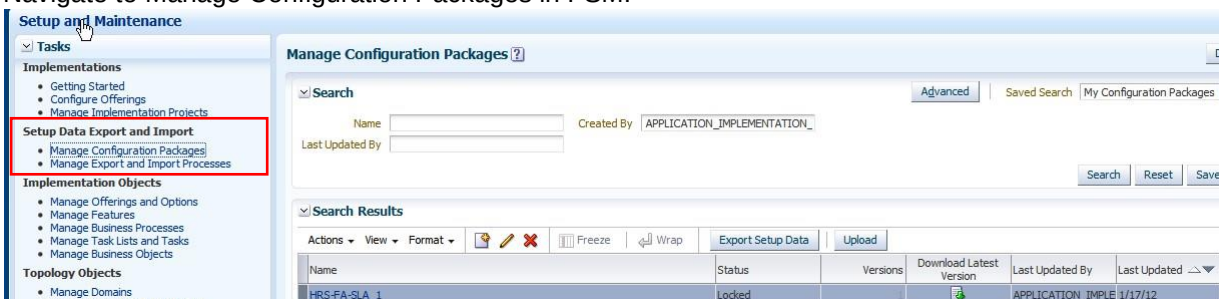

The Subledger Accounting setup needs to be done on a Test instance first and tested thoroughly entering all transactions to verify that the setup meets the requirements and no setup mistake has been made before exporting the setup.

Once one is sure that the setup is as desired and working well, then one can use the Setup Data Export and Import functionality in the Functional Setup Manager (FSM).

Make sure that an Implementation Project exists with the same setup steps that need to be exported:

Navigate to Manage Configuration Packages in FSM.

Create a new Configuration package by clicking on the New button. This page:

Create Configuration Package: Enter Basic Information

Source Implementation Project ?

* Name

Export ☐ Setup task list only
☒ Setup task list and setup data

Configuration Package Details

* Name

* Code

Description

? * Tracking Implementation Project

Pick the Implementation Project defines in step 1.

Subledger Accounting Method: Scope ?

Actions View Format Freeze Detach Wrap Reset

Without Parameters

Yes

Note that we cannot give our Accounting Method as a parameter to export. We will export the complete SLA setup data for application Assets. ALL SLA setups must be migrated together in the configuration package; there must be no partial migration i.e. migrate account rules now, but accounting methods later. Click on Next.

Enter Basic Information Select Objects for Export Schedule and Notifications

Name	Type	Configuration Package	Status	Download	Requested By	Process Date
HRS-FA-SLA_1	Export setup data	HRS-FA-SLA_1	Completed successfully		APPLICATION_IMPLE	1/19/12 12:47 PM
FIN DEN_1	Export setup data	FIN DEN_1	Completed with errors		APPLICATION_IMPLE	1/16/12 3:35 AM

Once the Export process completes one can download the Configuration Package into a .zip file, which is then moved to the target instance (i.e., the system where one wants the setup to be imported) and imported there. One can also download the Exports Results Report, the Setup Data Report, and the Process Status Details by clicking on the Download button.

After verifying the setup has been imported properly into the (i.e., target) instance, the Offering will be ready for transactions. Please **note** that we have only exported the Subledger Accounting setup. After importing this setup, one will still have to link the Accounting Method to the ledger and create Intercompany Balancing Rules if needed. FSM provides a set of reports on both exported and imported setup data to help in the verification process. For further information on the subject please search in MOS or check with the Oracle Fusion Functional Setup Manager team.
