CLEARING ACCOUNTS RECONCILIATION - GENERAL LEDGER

ORACLE FUSION FINANCIALS

Authored By
CA Uday Yelchuri

Preface

In Oracle Fusion Financials, several clearing accounts play a crucial role in transaction processing—such as the **Asset Clearing Account** in the Mass Addition process, the **AP Accrual Account** for PO/GRN-matched invoices, and the **Cash Clearing Account** during Payment Clearing.

At period end, along with key subledger control accounts (like Supplier Liabilities, Customer Receivables, and Asset Cost Accounts), finance teams also need to reconcile the balances sitting in these clearing accounts against the GL.

Ideally, clearing accounts should fully offset once the corresponding accounting events are completed. However, when transactions remain open, these balances accumulate, making it difficult for teams to identify the exact transactions contributing to the month-end balance.

While Oracle offers robust reconciliation tools such as **Payables to GL** and **Receivables to GL** reports for subledger control accounts, similar out-of-the-box reports are not available for clearing accounts.

The good news? Oracle provides a robust **Clearing Account Reconciliation** feature that allows users to efficiently track, match, and reconcile clearing account balances. You can examine those unreconciled journal entries that are both relevant and responsible for the buildup of the ending balance in a clearing account. Reconciliation can be performed automatically or manually.

In this document, I will walk through the configuration and demonstrate this functionality using the **Cash Clearing Account**, which is part of the **Payment Clearing Process**.

A) Setups:

a) Enable 'Reconciliation' Option at Ledger Level

On the **Specify Ledger Options** page, within the Reconciliation section, activate the primary and secondary ledgers for clearing account reconciliation by selecting the 'Enable Reconciliation' option as needed.

Defined a New Reconciliation Type: UY Cash Clearing Account Reconciliation

Reconciliation types can be defined at either the **chart of accounts** level or the **ledger level**. Chart of accounts-level setups apply to all related primary and secondary ledgers enabled for reconciliation and are recommended for easier maintenance.

If a specific ledger needs different rules, you can create a ledger-level reconciliation type instead.

Account Matching Rules and Account Filters:

When defining a reconciliation type, you must choose an **account matching rule**, which tells the system which chart of accounts segments matter when matching journal lines. Segments not included in the rule are ignored during grouping and reconciliation.

Available matching rules include:

- **Primary Balancing Segment + Natural Account**
- **Primary Balancing Segment + Natural Account + Cost Center**
- **Full Account Combination**

These rules determine how journal lines are evaluated and matched in the reconciliation process.

After choosing an account matching rule, you use **account filters** to define the segment values that represent valid clearing account combinations. Generally, you only specify values for the segments included in the selected matching rule.

In this tutorial, I chose the Account Matching Rule as **‘By Primary Balancing Segment & Natural Account’** and set the filter condition with Company Segment (101) and Natural Account (11506).

 If data isn't appearing on the Reconciliation page, it's likely because the transactions were created **before** the *Reconcile* flag was enabled at the GL account level. These older entries are treated as **historical journal lines**.

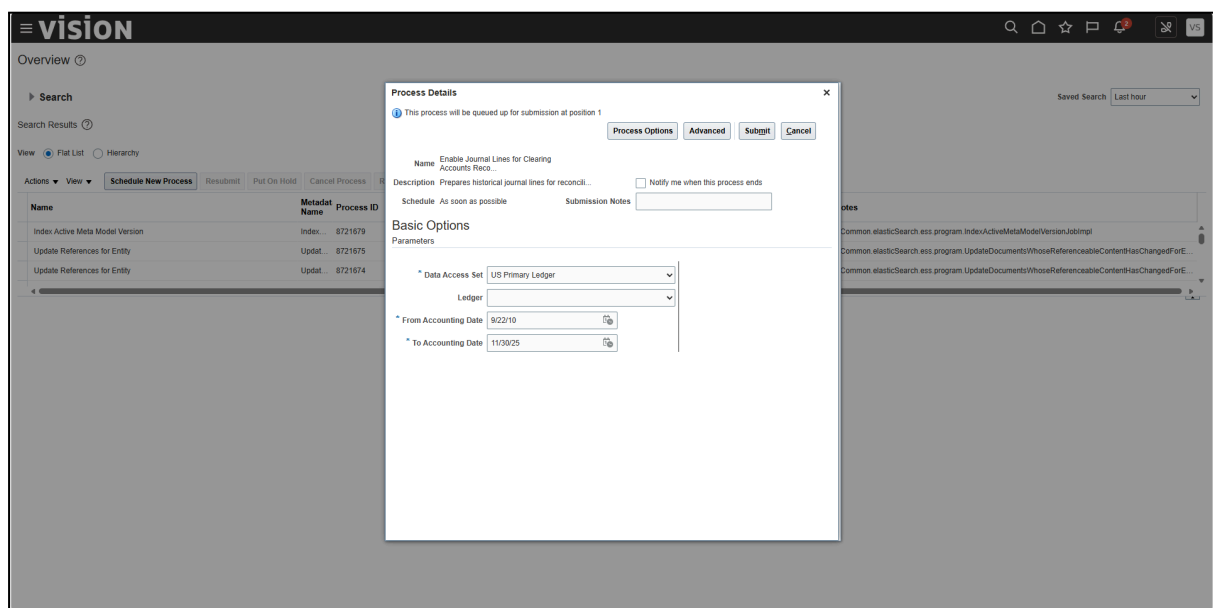

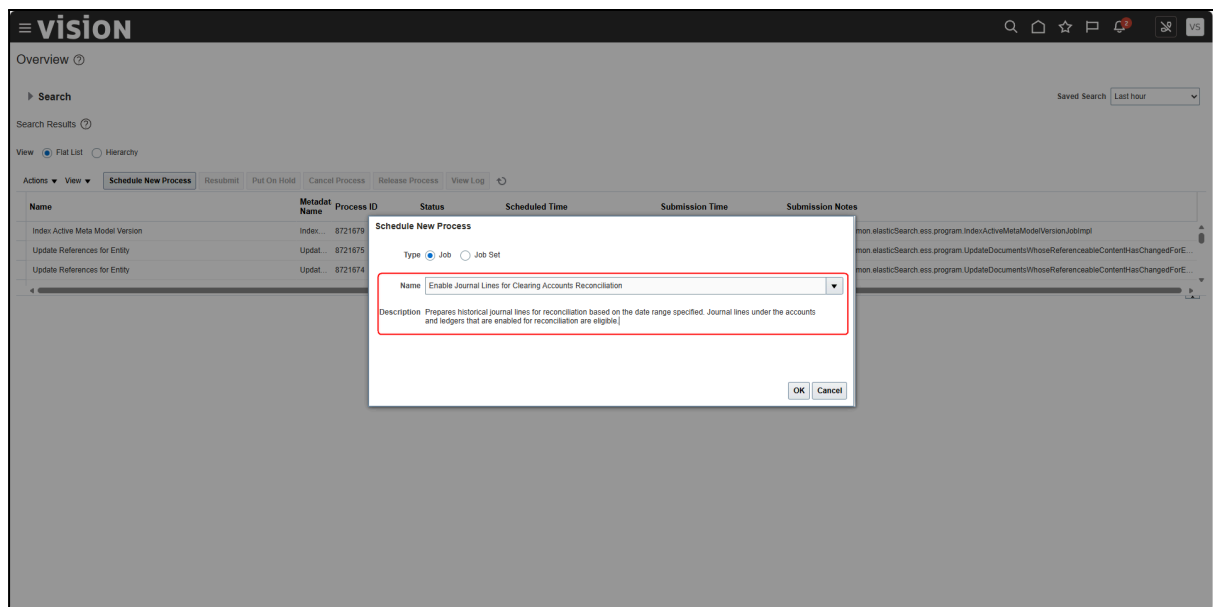

To make these historical journal lines available for reconciliation, you need to run the **Enable Journal Lines for Clearing Accounts Reconciliation** process.

You should run this process when:

- You want to reconcile existing clearing account journal lines that were already posted without reconciliation reference details.
- Clearing account reconciliation hadn't been enabled for the ledger or natural account values at the time those journals were originally posted.

The above Journal Line is generated when a Supplier Payment Transaction occurs [Dr - Liability A/C & Cr - Cash Clearing A/C]. After reconciling the payment in Cash Management by matching it with the Payment Transaction and recording it in accounting, an offset journal line [Dr - Cash Clearing A/C & Cr - Cash A/C] appears in the Reconciliation Page.

This line appears automatically because the transaction was created after the 'Reconcile' flag was enabled at the GL Account Level.

b) Automatic Reconciliation:

The automatic reconciliation process identifies and groups related clearing account journal lines and reconciles them automatically. It can process both reviewed and unreconciled lines.

Journal lines are considered related when they share the same ledger, reconciliation type, reconciliation reference, and clearing account combinations—based on the defined account matching rule and filters.

Reconciliation References and Journal Lines:

A reconciliation reference is a **unique identifier** entered or assigned to related clearing account journal entries. For example, an **invoice number** can serve as a reference, linking an invoice accrual clearing journal line with its corresponding offsetting line.

The automatic reconciliation process for clearing accounts uses these references, along with other criteria, to determine which journal lines should be grouped together.

When creating a journal in General Ledger, you can specify reconciliation references in the Journal Lines section on the Create Journal page. For **Sub Ledger Transactions**, **setting up Subledger Accounting** allows reconciliation references to be automatically populated on journal lines.

SLA Customization - To populate the Payment Transaction Number as the Reconciliation Reference for Cash Clearing Account Journal Lines.

As shown in the accounting entry below, the cash clearing account will be affected during payment creation and reconciliation. Therefore, identifying a common attribute as a reconciliation reference is essential for enabling Automatic Reconciliation.

In this tutorial, I will show how to populate the 'Payment Transaction Number' as a reconciliation reference. Since this is not available by default, we need to customize the SLA (Subledger Accounting).

Accounting Event	Journal Entry
Create Payment	AP Liability A/C Dr To Cash Clearing A/C Cr
Reconcile Payment	Cash Clearing A/C Dr To Cash A/C Cr

Identification of Journal Line Rules (JLR) Related to Payment Transactions for SLA Customization:

Now, only leftover transactions require manual intervention to reconcile.

Run the **Unreconciled Transactions** report to determine why journal lines weren't reconciled during automatic reconciliation. Possible reasons include:

- Anomalous reconciliation references or absence of reconciliation references on related journal lines.
- The total debits and credits of related journal lines do not sum to zero.
- Some transaction cycles might not have been completed, so not all related in-and-out journal lines were recorded in the system.

This can be manually reconciled as needed, or the Recon Reference can be updated, and the Automatic Reconciliation process can be proceeded with again.

c) Reverse Reconciliation for Clearing Accounts:

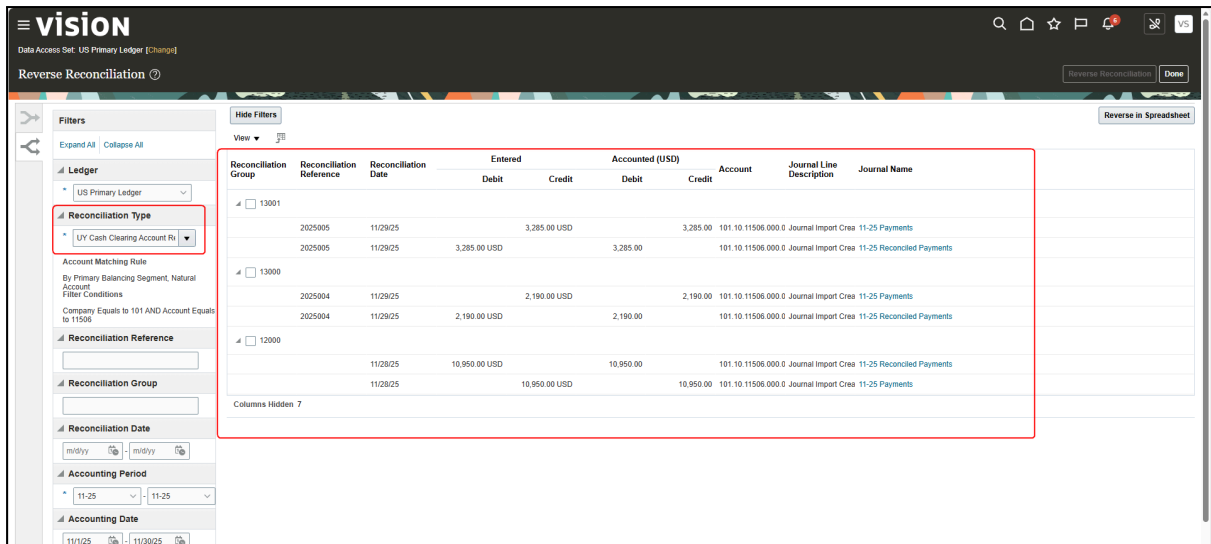

You can undo previously reconciled clearing account journal lines using either the Reverse Reconciliation page or the Reverse Reconciled Journal Lines spreadsheet. These can be accessed from the *Reverse Reconciliation* task in the Journals work area or from the *Reverse Reconciliation* tab on the Manual Reconciliation page.

Both manually and automatically reconciled lines can be reversed. Once reversed, the journal lines return to the unreconciled pool and become available for future reconciliation.

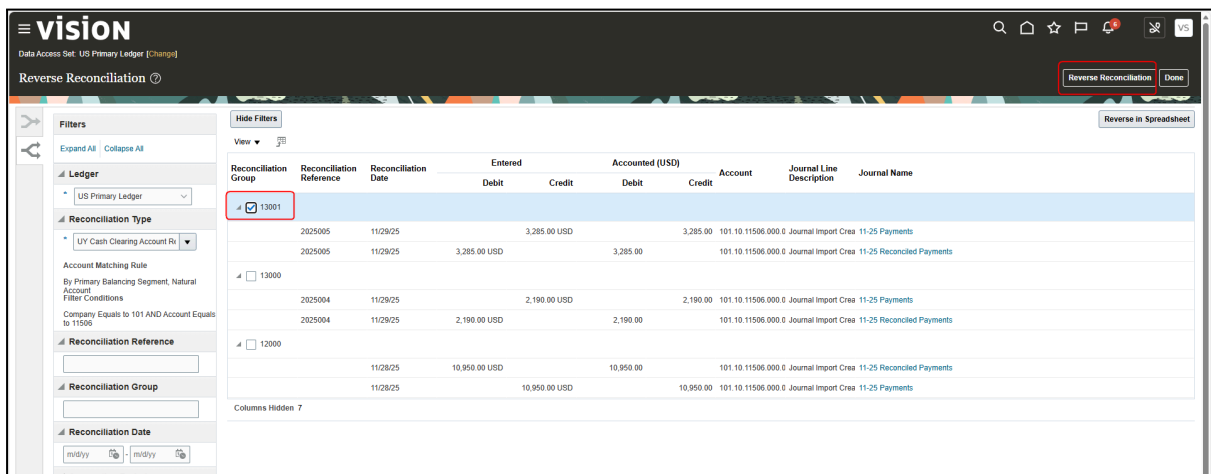

(N) General Ledger > Journals > Task List: Clearing Accounts Reconciliation > Reverse Reconciliation

When querying the Journal Lines using the available search criteria, the system displays previously reconciled journal lines (both manual and automatic) as shown below.

Select the necessary Reconciliation Group/Lines to reverse the reconciliation, & Click on the 'Reverse Reconciliation' Option available on the Page.

Post successful reversal, reversed journal lines will no longer appear.

Optionally use the 'Inquire on Journal Lines' window with status 'unreconciled' to review the lines that were reconciled in the previous step.

d) Reconciliation Via Spreadsheet:

Journal lines can be reconciled using the spreadsheet option available in the Manual Reconciliation Window.

Query the Journal Lines with the various search parameters that are available.

An ADFDi document, as shown below, will be downloaded with the data.

Update the 'Reconciliation Reference' for missing lines, then select 'Select All' to include all records in the Excel sheet for upload and reconciliation.

Updated records are marked as 'changed' by default, but it's crucial to ensure the 'Select All' option in the 'Manual Reconciliation' tab is chosen; otherwise, the upload might fail by considering only the updated records.
