

Expenses Agent for Cost Allocations and Additional Information

Use the Expenses Agent to split expenses across cost centers or projects and tasks.

The screenshot shows a mobile application interface titled "Split Allocations". At the top, there is a status bar with the time "9:41" and signal indicators. Below the title, there is a dropdown menu labeled "Split Expense By Account". Underneath, there are two radio buttons: "Percentage" (which is selected) and "Amount". The interface then displays two sections for account allocation, labeled "Account 1" and "Account 2", each with a close icon (X) to its right. For "Account 1", the "Percentage" field is set to "50" and the "Amount" field is set to "5". Below these, the "Company" field is "01 Operations" and the "Department" field is "100 Resources". For "Account 2", the "Percentage" field is also "50" and the "Amount" field is "5". The "Company" field is "01 Operations" and the "Department" field is "150 Human Resources". At the bottom of the form, there is an "Add Allocation" button. Below the form, there are two large buttons: "Cancel" and "Save".

Splitting an expense across accounts.

Business benefits include:

- Split Allocation enables accurate distribution of expenses across accounts or across projects and tasks, improving cost tracking and increasing productivity.

Steps to enable and configure

To use these capabilities, first enable Touchless Expenses as outlined in the [Touchless Mobile Expenses \(25D\)](#) feature.

Access requirements

No new access requirements.

Expenses Agent for Cash Advance Application

Use the Expenses Agent to apply cash advances manually when submitting expense reports.

Each cash advance has a due date, and employees are recommended to apply available cash advances by the due date; after that date, the cash advance is considered overdue.

9:41

Confirm submission

2 items - 630.00 USD

Justification

This trip hasn't occurred yet

Cancel

Submit

Don't apply cash advance and provide justification.

When an expense report is rejected, returned, or withdrawn, employees receive a notification indicating that the applied cash advance was removed.

The business benefit is organizations can reduce unapplied cash advances, capture justifications when employees decline cash advance application, and keep expense reports moving through auto-submit.

Steps to enable and configure

1. To use these capabilities, first enable Touchless Expenses as outlined in the [Touchless Mobile Expenses \(25D\)](#) feature.
2. Configure cash advance application settings for the applicable business units.
 - Sign in as an Application Implementation Consultant.
 - Navigate to Setup and Maintenance.
 - In the Financials offering, open the Expenses functional area.
 - Open the Manage Cash Advances and Authorization Policies task.
 - Search for and select the business unit that will use manual cash advance application.
 - Edit the applicable cash advance policy.
 - Set the Cash Advance Application option to Manual Cash Advance Application.
 - Click Save and Close.

Tips and considerations

- Employees can use the Expenses Agent to apply multiple cash advances to an expense report.
- Cash advances are applied at the expense report level, not at the individual expense line level.
- When a report is rejected, returned, or withdrawn, the applied cash advance is removed, the applied amount is credited back to the cash advance, and the due date remains unchanged.

Access requirements

No new access requirements.

Retirement Request Assistant

The Retirement Request Assistant streamlines the asset retirement process by providing a simplified way for asset custodians to submit and track asset retirement requests through a guided conversational experience.

Asset custodians can raise retirement requests in two ways.

Retire My Assets

Asset Custodians can start by typing “Retire my assets” from the assistant. to view and select assets assigned to them for retirement, or they can submit requests for assets that are not assigned to them by providing one of the identifiers like Serial Number, Tag Number, and Description. After selecting the assets, asset custodians can enter additional retirement details including Retirement Date, along with optional information such as Retirement Reason and Comments, before submitting.

Note :Once submitted, the request is processed by user through the Fixed Asset Retirement Assistant,, who reviews the request, updates the details if needed, and posts the retirement transaction.

My Asset Retirement Requests									
I've pulled together your recent asset retirement requests. Here's their current status.									
You've submitted 1 requests — 1 pending approval.									
Row	Request Id	Submission Date	Description	Tag Number	Serial Number	In Service Date	Retire Date	Retirement Reason	Status
1	20010	5/29/26	Dell UltraSharp 52 Thunderbolt Hub Monitor - US226KW without stand	IT-2026-0061	DELLX9A72P67	1/1/26	1/20/26	Sale	● Pending Approval

If you'd like, I can help you submit new requests.

The Retirement Request Assistant also enables asset custodians to view and track their recent retirement requests, including request ID, submission date, asset details, retirement date, and current status such as Pending, Posted, or Rejected.

My Asset Retirement Requests

I've pulled together your recent asset retirement requests. Here's their current status.

You've submitted 1 requests — 1 approved and posted.

Row	Request Id	Submission Date	Description	Tag Number	Serial Number	In Service Date	Retire Date	Retirement Reason	Status
1	20010	5/29/26	Dell UltraSharp 52 Thunderbolt Hub Monitor - US226KW without stand	IT-2026-0061	DELLX9A72P67	1/1/26	1/20/26	Sale	● Approved and Posted

If you'd like, I can help you submit new requests.

You can now view all available AI Agents from the **AI Agents and Applications** page To access this page, add **/fscmUI/redwood/human-resources/ai-studio/agent-explore** to the end of the URL for your application environment. For example, <https://example.com/fscmUI/redwood/human-resources/ai-studio/agent-explore>.

From the AI Agents and Applications page you can:

- Search for available agents
- View your conversations with agents
- Start or resume a chat session with an agent

Key Capabilities

- Submit retirement requests for assigned assets and non-assigned assets.
- Raise request to retire assets in any corporate book.
- Track recent retirement requests and statuses.

Business benefits include:

- Improved user experience through a simple self-service process for submitting and tracking asset retirements.
- Simplifies the retirement request submission process through a guided conversational experience
- Faster request handling by allowing users to submit retirement requests directly without manual coordination.
- Reduced operational effort by minimizing back-and-forth between users and support or operations teams.

Steps to enable and configure

You don't need to do anything to enable this feature.

Tips and considerations

- AI Agents and Applications page displays AI agents delivered by Financials. However, you can interact with the Retirement Request Assistant only if your job role grants access to it .
- The Retirement Request Assistant does not require data access to any asset book because the agent only raises a request to retire an asset.
- When raising a retirement request for an asset, make sure to enter all required details and submit the request. If you leave before submitting, the retirement request assistant will not save the information, and you will need to start the process again.
- Natural language conversation is English-only in this phase.
- For the best user experience, manually resize the assistant window to full screen.
- Enter *Help* in the assistant to access the help screen and view user guidance.

Key resources

Access requirements

To provide user access to the Retirement Request Assistant, complete these steps:

1. Navigate to the Security Console.
2. Create a new custom job role with the following details:
 - Role Name: Specify a name, for example, Retirement Request Custom Role
 - Role Code: Specify a code, for example, RETIREMENT_REQUEST_CUSTOM_ROLE
 - Role Category: Financials – Job Roles
3. Enable the Enable Permission Groups option
4. Navigate to Role Hierarchy > Roles and Privileges and add the following roles:
 - ORA_FUN_FIN_AI_AGENT_RUNTIME_DUTY_HCM
 - ORA_FUN_FIN_AI_AGENT_RUNTIME_DUTY

5. Navigate to Role Hierarchy > Roles and Permission Groups and add the following roles:

- ORA_DR_FAI_GENERATIVE_AI_AGENT_FIN_ADMINISTRATOR_DUTY
- ORA_DR_FAI_GENERATIVE_AI_AGENT_RUNTIME_DUTY
- ORA_FA_FIXED_ASSET_RETIREMENT_ASSISTANT_DUTY

6. Add the required users to the custom job role, then save and submit the role.

Retirement Assistant

Retirement Assistant is designed to simplify and streamline the asset retirement process through an intuitive conversational experience that helps fixed asset accountants submit, review, and process retirement activity more efficiently. The assistant also supports the processing of retirement requests submitted through the Fixed Asset Retirement Request Assistant, and resolve retirement exceptions through a conversational, guided experience.

Retire Assets:

You can provide retirement details by asking to retire a specific asset using an Asset Number, Serial Number, or Tag Number, and can also use operators such as starts with, contains, and ends with. Retirement details may also be provided by pasting text for one or more assets or by uploading a file. After the details are entered, the assistant shows the selected assets to review them before proceeding. At that point, the you can continue the retirement with the selected assets, add more assets, or remove selected assets.

Asset Retirement Details

Retirement reason is now SCRAP for asset 126307. Updated successfully.

Row	Book	Asset Number	Description	* Retirement Date	* Cost Retired	* Convention	Retirement Reason
1	VISION OPERATIONS CORP - USD	126307	Dell 27 240Hz Adjustable Stand Monitor - SE2726HGS	01/31/26	170.0	MONTH	SCRAP
	Proceeds of Sale 0.0 Cost of Removal 0.0	Tag Number IT-2026-0053 Serial Number DELLX9A72P59	Comments Asset Retirement through Agent				

All the assets have the required details. Reply with "proceed" to post the retirement transactions, or describe any changes you want to make.

Once you complete all retirement details for each asset including Retirement Date and Retirement Convention along with optional details such as Predefined Retirement Reason, Proceeds of Sale, Cost of Removal, and Transaction Comment, proceed to retire the asset. The assistant displays the posting status of each asset for review. If any retirements fail

during processing, users can review the failed retirements, update the necessary information, and resubmit the process.

You can now view all available AI Agents from the **AI Agents and Applications** page.To access this page, add `/fscmUI/redwood/human-resources/ai-studio/agent-explore` to

the end of the URL for your application environment. For example,
<https://example.com/fscmUI/redwood/human-resources/ai-studio/agent-explore>.

From the AI Agents and Application page you can:

- Search for available agents
- View your conversations with agents
- Start or resume a chat session with an agent

Key Capabilities

The Retirement Assistant provides the following capabilities:

- Retire a single asset or multiple assets through conversational and guided experience.
- Retire assets using Asset Number, Serial Number, or Tag Number.
- Upload files or paste text containing retirement details.
- View and resolve retirement exceptions.
- Process retirement requests submitted through the Retirement Request Assistant.

Business benefits include:

- Simplifies the asset retirement process through a guided experience.
- Reduces manual effort and simplifies complex retirement activities, enabling to complete retirements faster and with greater accuracy.
- Built-in validation and structured data collection help reduce errors.
- Reduces rework by allowing failed retirements to be corrected and completed without starting over.

Steps to enable and configure

You don't need to do anything to enable this feature.

Tips and considerations

- AI Agents and Applications page displays all headless AI agents delivered by Financials. However, you can interact only with the AI agents that your job role grants access to.
- Only full cost retirement is supported. Unit retirement and source line retirement are not supported.
- After the retirement is successfully posted, use the Asset Inquiry page to review the transaction details.

- Entry of Descriptive Flexfield (DFF) details is not supported when performing retirements through this assistant.
- Retire up to 25 assets in a single interaction. Create additional interactions if you have more than 25 assets to retire.
- Natural language conversation is English-only in this phase
- No workflow approvals are triggered when retirement transactions are processed through this assistant, even if the asset book is enabled for Retirement Approvals. This behavior applies to both retirements created directly within the assistant and retirements originating from the Retirement Request Assistant.
- For the best user experience, manually resize the assistant window to full screen.
- Enter Help in the assistant to access the help screen and view user guidance.

Key resources

[Explore AI Agents for Oracle Fusion Cloud Applications](#)

[How do I use AI Agent Studio?](#)

Access requirements

This Retirement Assistant requires data security access to asset book to create retirements, and to view and process retirement requests submitted through the Retirement Request Assistant. Access to asset book data can be granted through the above custom job role. If the user already has an Assets job role, then the existing book access granted to that role is sufficient. The job role should have the Retire Fixed Asset data security policy.

To provide user access the Retirement Assistant, complete these steps:

1. Navigate to the Security Console.
2. Create a new custom job role with the following details:
 - Role Name: Specify a name, for example, Retirement Request Agent Custom Role
 - Role Code: Specify a code, for example, RETIREMENT_AGENT_CUSTOM_ROLE
 - Role Category: Financials – Job Roles

3. Enable the Enable Permission Groups option
4. Navigate to Role Hierarchy > Roles and Privileges and add the following roles:
 - ORA_FUN_FIN_AI_AGENT_RUNTIME_DUTY_HCM
 - ORA_FUN_FIN_AI_AGENT_RUNTIME_DUTY
5. Navigate to Role Hierarchy > Roles and Permission Groups and add the following roles:
 - ORA_DR_FAI_GENERATIVE_AI_AGENT_FIN_ADMINISTRATOR_DUTY
 - ORA_DR_FAI_GENERATIVE_AI_AGENT_RUNTIME_DUTY
 - ORA_FA_FIXED_ASSET_RETIREMENT_ASSISTANT_DUTY
6. Add the required users to the custom job role, then save and submit the role.

Fixed Asset Inquiry Assistant

The Fixed Asset Inquiry Assistant provides a conversational way to access asset information. The assistant helps to quickly retrieve information about fixed assets in a book and obtain a summary of the asset activities for the current period through a guided, self-service experience.

Use natural language interactions to find fixed assets in a book by providing any one of the following details: Asset Number, Tag Number, Serial Number, or Asset Description.

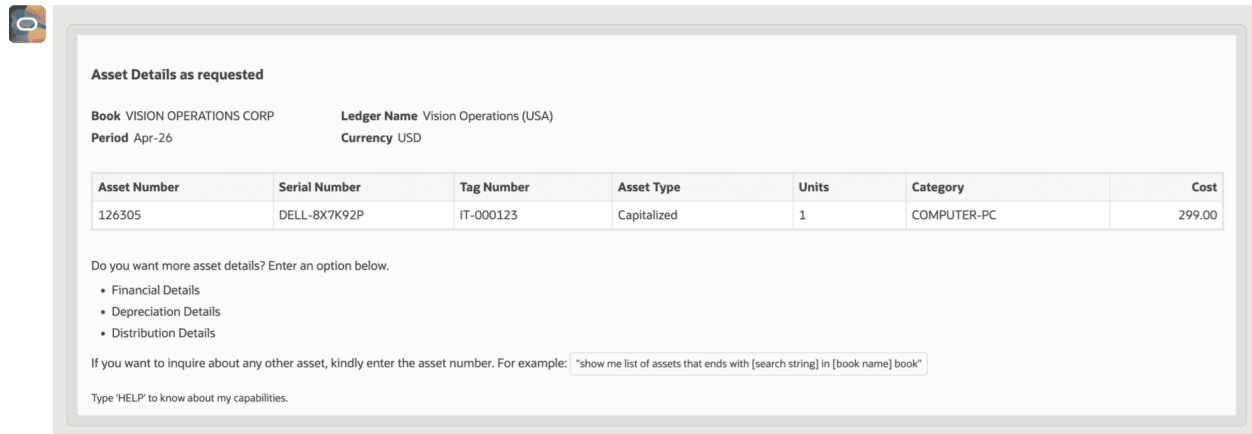

You can also use operators such as starts with, contains, and ends with.

You can ask the assistant to show the following categories of details for a particular asset:

- General
- Financial
- Depreciation
- Distribution

When you request details for a specific category, the Assistant shows the corresponding list of attributes for the asset. For example, if you ask to show the General details of an

asset, the Assistant shows the following attributes: Asset Number, Serial Number, Tag Number, Asset Type, Units, Category, and Cost.

Asset Details as requested

Book VISION OPERATIONS CORP Ledger Name Vision Operations (USA)
Period Apr-26 Currency USD

- Distribution Details

If you want to inquire about any other asset, kindly enter the asset number. For example: "show me list of assets that ends with [search string] in [book name] book"

If you ask to show the distribution details of an asset, the Assistant shows: Asset Number, Location CCID, Units Assigned, Unit, and Distribution ID.

You can view asset activity for the current accounting period within a selected asset book. The assistant summarizes transactions and activity such as asset additions, adjustments, transfers, and retirements events, providing a snapshot of the number of transactions in progress and posted. This provides a convenient way to monitor recent asset activity and understand changes affecting the selected book during the current period. The user can then drill down into recent transactions to review and validate activity affecting asset balances and depreciation. This visibility helps support period-end reconciliation, transaction verification, audit inquiries, and analysis of changes within an asset book.

If you would like to see the transaction details for this book, type:

"show me recent transaction details in [book name] book"

Type "HELP" to know about my capabilities.

You can now view all available AI Agents from the AI Agents and Applications page. To access this page, add /fscmUI/redwood/human-resources/ai-studio/agent-explore to the end of the URL for your application environment. For example, https://example.com/fscmUI/redwood/human-resources/ai-studio/agent-explore.

From the AI Agents and Applications page you can:

- Search for available agents
- View your conversations with agents
- Start or resume a chat session with an agent

Key Capabilities

The Fixed Asset Inquiry Assistant provides the following capabilities:

- Enables quick access to asset information without navigating through multiple pages or reports gaining visibility into asset details and current period activity..
- Improves user productivity by consolidating fixed asset information into a single inquiry experience.

Business benefits include:

- Eliminates manual effort in retrieving asset data and reduces the time taken to search for asset information.
- Enables users to access information pertaining to assets quickly using natural language interaction.
- Improves overall user productivity and efficiency by providing real time and accurate asset information.

Steps to enable and configure

You don't need to do anything to enable this feature.

Tips and considerations

- The Assistant displays a maximum of 10 of the most recently added assets. You can refine your search by providing the Asset Number, Asset Description, or Serial Number of the asset that you want to inquire about.
- You need to specifically ask for the Net Book Value (NBV) of an asset.
- The transaction details for an asset or book show only the 5 most recent transactions.
- The assistant can only inquire on one asset book at a time and can't support multiple books in a single question.
- It is recommended to use a single asset book per chat conversation. If you need to inquire about assets from another book, initiate a new chat conversation.

- The depreciation details display current period amounts based on the most recent depreciation run.
- The Assistant can display depreciation details of an asset for the three most recent accounting periods only.
- Natural language conversation is English-only in this phase.
- For the best experience, manually resize the assistant window to full screen.
- Enter Help in the assistant to access the help screen and view user guidance.

Key resources

- [Explore AI Agents for Oracle Fusion Cloud Applications](#)
- [How do I use AI Agent Studio?](#)

Access requirements

The Fixed Asset Inquiry Assistant requires data security access to asset books in order to accept and process inquiries about specific assets. Access to asset book data can be granted through the above custom job role. If the user already has an Assets job role, then the existing book access granted to that role is sufficient. The job role should have the Submit Fixed Asset Reports data security policy.

To provide user access to the Fixed Asset Inquiry Assistant, complete these steps:

1. Navigate to the Security Console.
2. Create a new custom job role with the following details
 - Role Name: Specify a name, for example, Retirement Request Agent Custom Role
 - Role Code: Specify a code, for example, INQUIRY_AGENT_CUSTOM_ROLE
 - Role Category: Financials – Job Roles
3. Enable the Enable Permission Groups option
4. Navigate to Role Hierarchy > Roles and Privileges and add the following roles:
 - ORA_FUN_FIN_AI_AGENT_RUNTIME_DUTY_HCM
 - ORA_FUN_FIN_AI_AGENT_RUNTIME_DUTY

5. Navigate to Role Hierarchy > Roles and Permission Groups and add the following roles:
 - ORA_DR_FAI_GENERATIVE_AI_AGENT_FIN_ADMINISTRATOR_DUTY
 - ORA_DR_FAI_GENERATIVE_AI_AGENT_RUNTIME_DUTY
 - ORA_FA_FIXED_ASSET_INQUIRY_ASSISTANT_DUTY
6. Add the required users to the custom job role, then save and submit the role.

Budget Adjustment Assistant

The **Budget Adjustment Assistant** helps budget office users create budget entries using natural language for **Enterprise Performance Management (EPM) control budgets**. The assistant helps resolve any creation issues before the budget transaction is submitted. Users can also review approved budget entries and check budgetary control balances.

Use the Budget Adjustment Agent to:

- Add/Reduce budget to a budget account, period, control budget.
- Transfer budget amounts between accounts and periods
- Review Budgetary Balances
- Review Budget Entries

Users can enter 'help' and the assistant will show examples of what it can do.

What can you help me with?

I can help with budget changes, reviews, and budgetary control questions. For example: "Add 10,000 to control budget CORP-BUDGET for account 4000-1000 in Period 2026-06."

Supported operations (brief):

- Add or reduce budget
- Transfer budget between periods
- Transfer budget between accounts
- Review budget entries
- Review budgetary control balances
- List accessible control budgets
- Answer conceptual budgetary control questions

Budget Adjustment Assistant Help Response

The **Budget Adjustment Assistant** helps budget office users work more efficiently by creating budget entries for **Enterprise Performance Management (EPM) control budgets** using natural language. It guides users through budget adjustments, helps identify and resolve creation issues before submission, and provides quick access to approved budget entries and budgetary control balances.

Key business benefits include:

- **Improves productivity** by allowing users to create budget adjustments through simple natural language prompts instead of navigating multiple pages or forms.
- **Reduces errors before submission** by helping resolve budget entry creation issues before the transaction is submitted.
- **Supports faster issue resolution** by helping users identify problems during entry creation and take corrective action earlier.

Steps to enable and configure

The Budget Adjustment Assistant role is needed to use the assistant within the AI Agent Studio. Refer to the Access Requirements section for details.

Tips and considerations

- The control budget must have source budget type **EPM Financials module**
- Existing control budget security is enforced: users must either have created the control budget, be the named budget manager, or have been assigned data access to specific control budget
- When you see “Sorry, the assistant is unavailable right now. If the issue persists, contact your help desk,” it may indicate an incomplete setup. Verify that all access requirements have been met.

Invoice Import with Supplier Bank Account Details Using Collaboration Messaging Framework

Import B2B XML invoices in Fusion Payables with supplier Remit-to Bank Account Number and Supplier IBAN using the Collaboration Messaging. The Collaboration Messaging inbound payload containing the supplier external bank account information, are interfaced to Fusion Payables.

B2B invoices that are exchanged between Sellers and Buyers electronically are interfaced to Fusion Payables using the Collaboration Messaging-Payables webservice. For suppliers with multiple bank accounts, Oracle customers need to be able to import Supplier invoices with the specific bank account. When the optional supplier external bank account number and IBAN are supplied in the inbound XML and pass validation, the invoice installment is automatically populated with those bank details, enabling direct electronic payments. If the values are omitted, the system looks for a primary bank account associated with the supplier. The AP web service now exposes the **ExternalBankAccountNumber** and **ExternalBankAccountIbanNumber** fields for transmission through Collaboration Messaging to the AP invoice interface. The corresponding columns, **EXTERNAL_BANK_ACCOUNT_NUMBER** and **EXT_BANK_ACCOUNT_IBAN_NUMBER**, already exist in the **AP_INVOICES_INTERFACE** table.

For French localization, Oracle customers rely on Collaboration Messaging to process inbound AP invoice messages that carry supplier external bank account details.

Exposing **ExternalBankAccountNumber** and **ExternalBankAccountIbanNumber** in the AP web service delivers clear, measurable value: it enables customers to consistently select and transmit the correct bank account for suppliers with multiple accounts, strengthens compliance with French localization requirements, and reduces payment errors and rework by ensuring installments are populated with validated remit-to bank details. In scenarios where the invoice is marked **"Remit to Supplier"** without explicit bank details, the import will fall back to the primary bank account of the third party supplier linked to the invoice.

Business Benefit

Enables seamless import of B2B XML invoices with supplier bank account details (Remit-to Bank Account Number and IBAN) via the Collaboration Messaging, ensuring accurate and efficient supplier payments in Fusion Payables.

Steps to enable and configure

You don't need to do anything to enable this feature.

Tips and considerations

- The supplier external bank account number and IBAN fields are optional in the inbound XML; providing them results in direct population of the invoice installment's bank details.
- If these fields are omitted, the system falls back to the primary bank account, preferring a site level account when both site and supplier primary accounts exist.
- Supplying values that fail format or validation checks will cause the import to be rejected, preventing erroneous payment information from being stored.
- For invoices marked "Remit to Supplier" without explicit bank details, the system uses the primary bank account of the third-party supplier associated with the invoice.
- The behavior applies to both matched and unmatched invoices processed through the Payables invoice import process.

Calculation Calendar for Secondary Representation

Generate lease amortization schedules and accounting entries for the secondary representation using a calculation calendar that is different from the primary representation. For example, configure a 4-4-5 calendar for the primary representation and a monthly calendar for the secondary representation to align with statutory or managerial reporting needs. Lease expenses and income are generated in accordance with the calculation calendars specified for each representation.

To create leases with the separate calculation calendars by representation:

1. Create a lease for property or equipment and select the primary and secondary accounting classification.
2. Create assets and add payments.
3. Validate the lease and generate schedules.
4. Use the Schedules tab to review the amortization schedules calculated using the respective calculation calendars for the primary and secondary representations.
5. Approve and activate the lease.
6. Run the Process Lease Accruals program to create the accrual transaction and recognize the expense or revenue according to the schedule.
7. Complete the below parameters according to your requirements to identify the leases and accounting periods to process accruals for both primary and secondary representations:
 - Business Unit: Mandatory. Select a Business Unit.
 - Lease Number: Optional. Select a Lease Number to process accruals for a specific lease.
 - Period: Optional. Select Period to process accruals till the selected period end date or leave blank to process accruals till the system date.
 - Accrual Date: Optional. Enter Accrual Date to process accruals till the Accrual Date.

The following screenshots describe viewing the lease amortization schedules by representation for expense and revenue leases:

Process Accruals for Property Revenue Leases

Business benefits include:

- Aligns secondary representation lease accounting with local or statutory reporting requirements, enhancing compliance and auditability.
- Enables organizations to accurately record and report leases in multiple reporting frameworks, reducing manual adjustments and potential errors.
- Improves operational efficiency by automating the calculation and accounting processes based on the selected calculation calendars.

Steps to enable and configure

Complete these settings in Manage Lease Accounting Configuration:

1. Navigate to the Create or Edit System Options page.
2. Select the Primary and Secondary Accounting Standards and Ledgers.
3. Select the Interest Calculation Method as Daily Compound Interest and the Amortization Calculation Frequency as Daily Amortization.
4. Select the Calculation Calendar for the primary representation.
5. Enter the Override Secondary Calculation Calendar to use a different calculation calendar for the secondary representation.

System Options page

Tips and considerations

The Override Secondary Calculation Calendar system option is enabled for update only for those business units that do not have any active leases.

Lease Migration Balances by Representation

Capture separate right-of-use asset and accumulated amortization balances for both primary and secondary representations when importing midlife expense leases. Record either gross or net right-of-use asset balances and their corresponding accumulated amortization for each representation during the migration of lease portfolios.

To create expense leases with separate migration balances by representation:

1. Create an expense lease for property or equipment.
2. Update lease details to enable the Migrated Lease option and select the Right-of-Use Basis as Net or Gross.
3. Create an asset and add a payment.
4. Update the accounting details on the payment and enter the migration balances:
 - Enter Primary and Secondary Net Right-of-Use if the Right-of-Use Basis is Net.
 - Enter Primary and Secondary Gross Right-of-Use and Accumulated Amortization amounts if the Right-of-Use Basis is Gross.

The following screenshots describe the process of creating a migrated expense lease with right-of-use assets and accumulated amortization balances by representation:

Lease Impairments by Representation

Record lease impairments by capturing impairment percentages and recoverable values separately for primary and secondary representations. Lease administrators can create impairment transactions to write down the right-of-use asset balances for each representation, supporting compliance with varying regulatory or reporting requirements across different jurisdictions.

To impair leased assets with separate impairment details by representation:

1. Search and select the expense lease to impair.
2. Select Impair Lease action and enter the Effective Date.
3. Navigate to the Assets tab and select the asset to impair.
4. Select the Impairment Type as percentage or amount-based and enter Percentage of Asset Value for Impairment.

5. Enter the Primary and Secondary Impairment Percentage for percentage-based impairments.
6. Enter the Primary and Secondary Recoverable Value for amount-based impairment.
7. Validate the lease, generate schedules, approve, and activate the lease impairment.

The following screenshots describe creating an impairment with separate impairment details by representation:

The screenshot shows the 'Leases' page with a sidebar on the left containing various actions. The 'Impair Lease' option is highlighted with a red box. The main area contains a form for creating a new lease with fields for Business Unit, Lease Type, Lease Number, Party Name, Lease Start Date, Legal Entity, Lease Name, Asset Type, Primary Accounting Classification, and Status. Below the form is a table of existing leases.

Business Unit	Lease Number	Lease Type	Party Name	Lease Name	Lease Start Date	Asset Type	Primary Accounting Classification	Status	Version Status

Accrued Expense Migration for Exempt Payments

Import midlife leases with exempt payments by capturing accrued expense migration balances and recognizing exempt payments as expenses evenly over the remaining lease term. Periodic expenses are calculated by dividing the total exempt payment, net of accrued expense migration balance, by the number of remaining periods.

To create an expense lease with accrued expense migration balance for exempt payments:

1. Create an expense lease for property or equipment.
2. Update lease details to enable the Migrated Lease option.
3. Add an asset and an exempt payment to the lease. To add an exempt payment, the lease classification must be Exempt or the Right-of-Use and Lease Liability options on the payment must be unchecked.
4. Navigate to the Accounting tab in the Payment Details page.
5. In the Exempt Expense section, select the Amortize Over Term option and enter the Accrued Exempt Expense for the Primary or Secondary representation as applicable under Migration Balances. The Accrued Exempt Expense is the difference between the exempt expense accrual and payment amounts prior to the Amortization Start Date.
6. Validate the lease and generate schedules.

7. Use the Schedules tab to view the expense recognition schedule before lease activation.

The following screenshots describe the process of creating an exempt lease with accrued exempt expense migration balance:

The screenshot displays the 'Lease Details' page of a software application. The page is divided into several sections, each with a collapse icon (triangle) and a title. The sections are: Lease Details, Term Details, Amortizations, Document Details, and Migration. The 'Lease Details' section contains fields for Legal Entity (Vision Operations), Lease Name (3117), Party Name (Allied Manufacturing), Asset Type (Property Lease), Options Class (Lease Level), Allow Subleases (Yes), Subleased Assets (No), and Require Property Definition (No). The 'Term Details' section shows Lease Start Date (01/01/26) and Lease End Date (12/31/27). The 'Amortizations' section shows Amortization Start Date (04/01/26), Amortization End Date (12/31/27), and Proration Method (Days/Month). The 'Document Details' section is currently collapsed. The 'Migration' section shows a 'Migrated Lease' checkbox that is checked. The 'Primary Accounting Classification' is set to 'Exempt'. The 'Lease Term' is 2 Years, 0 Months, 0 Days. The 'Date Signed On' is mm/dd/yy. The 'Migration Date' is 04/01/26.

Automated Invoice Generation and Revenue Recognition for Equipment Leases

Automatically generate periodic invoices and recognize revenue for equipment leases.

LEASE INVOICE PROCESSING

Lease administrators can invoice lessees for rent, service, maintenance, and other charges defined in the lease. Lease payments are transferred to Oracle Fusion Receivables to create invoices.

The Process Equipment Revenue Lease Payment process provides the ability to:

- Auto-approve and Transfer payments to the Receivables Interface. Transfer all draft payments or limit the transfer to a single lease, or to payments within a specific date range, or to payments for a particular customer and bill-to site, payment type, or payment purpose.
- Launch Receivables Invoice Import AutoInvoice as part of the lease process.
- Put payments on hold and subsequently release the hold.

The invoice number is available on the Schedules tab for a lease after the payment interfaces to Receivables and the Process Equipment Revenue Lease Payment Tie Back process is run.

The following screenshots describe processing payments for equipment revenue leases and reviewing payment schedules with drilldown to Receivables Invoices:

The screenshot displays the Oracle Fusion Leases interface. On the left, the 'Search Leases' section includes filters for Business Unit (Vision Operations), Lease Type (Revenue Lease), Lease Number (L_100), Party Name, and Lease Start Date (mm/dd/yy). Below the filters is a table with columns: Business Unit, Lease Number, Lease Type, Party Name, Lease Name, and Lease Start Date. The table contains two rows of data. On the right, a side panel titled 'Leases' lists various navigation links under categories: Leases, Expense Lease Payments, and Revenue Lease Payments. Two links in the Revenue Lease Payments section are highlighted with red boxes: 'Process Payments for Equipment Revenue Leases' and 'Process Payment Tiebacks for Equipment Revenue Leases'.

Schedules - Payment Schedules

LEASE REVENUE RECOGNITION

Recognize lease revenue each period according to lease accounting standards. When the Lease Administrator creates the lease, the revenue recognition schedule is automatically generated. For operating leases, the revenue is evenly spread over the revenue recognition

term. The lease revenue recognition process creates the transaction to reduce the accrued asset balance and recognizes the revenue according to the schedule.

The following screenshots describe processing accruals for equipment revenue leases and reviewing accrued revenue schedules:

Schedules - Accrued Revenue

Business benefits include:

- Ensure compliance with lease accounting standards for equipment revenue leases.
- Increase productivity and reduce errors through automated invoice generation and revenue recognition.
- Minimize manual effort in billing and collections via automated integration with Oracle Receivables.
- Enhance transparency by making Receivables invoices from Lease Accounting visible within lease record.

Steps to enable and configure

Use the Opt In UI to enable this feature. For instructions, refer to the Optional Uptake of New Features section of this document.

Offering: *Financials* No Longer Optional From: *Update 27A*

If you plan to adopt this feature, then you must log an SR with Oracle Support to get a code.

Liability Reclassification Calculation Options for Negative Short-Term Liability

Configure alternate calculation methods for reclassifying lease liabilities using the Amortized Liability Balance approach. Choose between Simple Amortized Liability Balance and Adjusted Amortized Liability Balance methods to break out the lease liability into short-term and long-term for disclosure reporting.

Simple Amortized Liability Balance determines short-term liability by aggregating payments for the next 12 months minus the sum of interest expenses for the same period. The long-term liability is then calculated as the difference between the total discounted lease liability at the current month-end and the short-term liability.

Adjusted Amortized Liability Balance applies the same calculation methodology but reports the month-end short-term liability as zero if the calculated short-term liability value is negative and the total discounted lease liability at the current month-end remains positive. In such cases, the entire discounted lease liability balance at the current month-end is classified as long-term liability.

Select the appropriate lease liability reclassification method based on your organization's accounting policy.

Business benefits include:

- Automates the reclassification of lease liabilities, reducing manual effort and errors.
- Improves efficiency and saves time at period-end by streamlining liability calculations.

Steps to enable and configure

Use the Opt In UI to enable this feature. For instructions, refer to the Optional Uptake of New Features section of this document.

Offering: *Financials* No Longer Optional From: *Update 27A*

To enable this feature:

1. Navigate to the Manage Lease Accounting Configuration for the relevant business unit.
2. Locate the Liability Reclassification Method system option.
3. Select one of the available methods based on your organization's accounting policy.

The following screenshot describes configuring the Liability Reclassification Method system option:

Tips and considerations

- The Liability Reclassification Method Amortized Liability Balance is now upgraded as the Adjusted Amortized Liability Balance.
- A one-time system options update may be done to change the Liability Reclassification Method from Short-Term Present Values to either Adjusted Amortized Liability Balance or Simple Amortized Liability Balance methods.
- A one-time system options update may be done to change the Liability Reclassification Method from Adjusted Amortized Liability Balance to Simple Amortized Liability Balance method.

Subsidies, Origination, and Interim Rent Payments in Equipment Revenue Leases

Create and bill one-time payments for subsidy, origination charges, and interim rent at lease inception, associating each payment with specific assets. Automatically generate revenue recognition schedules and accounting entries for these payments.

To create leases with payments for interim rent, subsidies, and origination charges:

1. Create an equipment revenue lease and add assets.
2. Create rent payments by selecting Payment Category as Rent and Payment Phase as Base Term.
 - Select a payment template and associate each payment to an asset.
 - The payment and transaction tax details default from the payment template and may be updated as needed.
 - Update the payment details such as payment amounts, frequency, and number of payments.
3. Create one-time payments for interim rent payment by selecting Payment Category as Rent and Payment Phase as Interim.
 - Select a payment template and associate each payment to an asset.
 - The payment and transaction tax details default from the payment template and may be updated as needed.
 - Update the payment amount.
4. Create one-time payments for subsidy by selecting Payment Category as Subsidy.
 - Select a payment template and associate each payment to an asset.

- The payment and transaction tax details, accrual type, and accounting distributions default from the payment template and may be updated as needed.
 - Update the payment amount.
5. Create one-time payments for origination charges by selecting Payment Category as Origination.
 - Select a payment template and associate each payment to an asset.
 - The payment and transaction tax details, accrual type, and accounting distributions default from the payment template and may be updated as needed.
 - Update the payment amount.
 6. Validate the lease and generate schedules.
 7. Review the payment and income amortization schedules for rent, interim rent, subsidies, and origination charges before activating the lease:
 - For operating leases, the total revenue from rent and interim rent is evenly spread over the revenue recognition term as rental accrual.
 - Income amortization schedules are generated for subsidies and origination charges when the Accrual Type is Upfront or Amortized.
 8. Approve and activate the lease.

The following screenshots describe creating payments and viewing schedules for rent, interim rent, subsidies, and origination charges:

Integrated Virtual Card Payments for Supplier Invoices - Additional Banks

Pay supplier invoices with virtual cards to improve payment efficiency and cash flow. The embedded virtual card program has been extended in 26C to support an additional issuer - Bank of America. Previously announced issuers include: Banco Bradesco, Barclays, Brex, Emirates NBD, First Abu Dhabi, HSBC, J.P. Morgan, National Westminster Bank, Royal Bank of Scotland, Wells Fargo, and Westpac.

The solution enables organizations to activate card programs quickly with the bank, onboard suppliers that accept cards for invoices, and automate virtual card generation for high-volume payment processing.

For additional information refer to the feature in [25B What's New](#).

Business Benefits

Implementing virtual cards for supplier payments in Oracle Fusion Cloud ERP offers numerous benefits for businesses:

- **Enhanced security** to pay invoices with cards, eliminating the need to store suppliers' bank account information.
- **Better cash flow** for buyers to leverage credit to pay suppliers, instead of the traditional ACH, wire or check methods.
- **Streamlined payment process** that increases efficiency and reduces administrative overhead related to check processing.
- **Improved payment tracking** with acknowledgment notification directly in ERP.
- **Global accessibility** through several global and regional banks offering embedded virtual card payments.

Steps to enable and configure

Integrated Virtual Card Payments for Supplier Invoices is now generally available. A promotion code is no longer required to enable this feature.

For steps to enable refer to the feature in [25B What's New](#).

Tips and considerations

- Let your bank know you want to use the embedded ERP virtual card integration. Be as specific as possible about your desired timeline. This will help the bank allocate implementation resources to help you test the end-to-end payment process in the targeted timeframe.
- Please go through the steps in the Implementation Guide thoroughly, as it guides you through defining program parameters and updating supplier information. It also explains how to perform an end-to-end test with your bank using a “penny test” to validate connectivity in production.

Key resources

- Customer Connect webinar recording from 05-Feb-2025: [ERP – What’s New with Virtual Cards for Supplier Payments](#)
- Oracle and Mastercard’s Embedded Virtual Card Solution [video](#)

Access requirements

You must have the **Financial Application Administrator** job role to establish connectivity and review all related predefined and automatically configured Functional Setup Manager tasks.

Original Invoice and Credit Memo References for Rebill Invoices

Use the Rebill Source Transaction field in the Create or Edit Transaction page to associate a rebill invoice with its original invoice, improving traceability during rebill transactions.

When creating or editing a rebill invoice, enter the original invoice in the Rebill Source Transaction field. If creating the rebill invoice using the user interface, select the original invoice from the list of values. If creating the rebill invoice using AutoInvoice or REST services, populate the rebill source transaction details on the interface line or payload.

The application validates that the referenced invoice is eligible for rebilling. After the rebill invoice is completed, the Rebill Source Transaction field becomes read-only, and you can drill down to the source transaction to review details. From the source transaction, review related credit memo information in the Transaction Activities window.

These are the business benefits:

- This feature improves audit traceability and supports regulatory compliance by enabling you to explicitly associate rebill invoices with their source transactions.
- It reduces manual reconciliation effort, minimizes errors, and provides better visibility into transaction relationships across systems.

Steps to enable and configure

You don't need to do anything to enable this feature.

Tips and considerations

- The Rebill Source Transaction field only contains transactions of the Invoice transaction class.
- The field is available for all rebill invoices, including those invoices created without performing a credit application against the original invoice.
- The referenced original invoice must exist and be complete.

- The Rebill Source Transaction field becomes read-only after the rebill invoice is completed, and drill-down is available only after completion.
- The rebill source transaction reference isn't supported using Receivables SOAP services.

Key resources

Refer to the REST API for Oracle Financials Cloud documentation for details on Receivables transaction services.

Access requirements

No new access requirements.

AutoApproved Multitier Intercompany Transaction

Automatically create intercompany transactions, intercompany invoices, and accounting entries by enabling autoapproval of intercompany transactions. This feature streamlines intercompany processing while maintaining the flexibility to apply manual controls when required.

A new Approval Flow column is available on the Intercompany Document Preparation page. Transactions default to a manual approval flow, allowing you to review and approve transactions using the existing process. You can now update the approval flow to autoapproval. When set to autoapproval, the application bypasses the approval step and automatically creates and completes transfer authorizations, processes transactions in Multitier Intercompany Operations without requiring manual approval, and generates intercompany journal entries or intercompany Receivables and Payables invoices.

This feature applies to:

- Intercompany transactions originating from Payables cross charge invoices, where invoice data is transferred to Document Preparation for intercompany processing.
- Transfer authorizations created directly in Multitier Intercompany Operations.

Intercompany Payables invoice creation remains manual by default to allow review and adjustment of intercompany Receivables invoices. You can optionally enable the automatic creation of intercompany Payables invoices.

These are the business benefits:

- Reduces manual effort by automating intercompany transaction processing.
- Accelerates transaction processing by eliminating manual approval steps.
- Processes high volumes of intercompany transactions without increasing manual effort.
- Improves data accuracy and consistency by minimizing manual intervention.

Steps to enable and configure

You don't need to do anything to enable this feature.

Key resources

- [Multitier Intercompany Operations section](#) in the Using General Ledger guide – To understand the flow of creating agreement, intercompany transfer authorization, intercompany transaction using the Multitier Intercompany Operations.
- [Multitier Intercompany Operations topical essay](#) - To learn more about the rationale for different types of intercompany transactions and for additional guidance on organizational structures.
- [Automated Intercompany Cross Charge of Payables Invoice section](#) in the Using General Ledger guide – To understand the processing of Payables cross charge invoices.
- [How Payables Standard Invoice Import Data Is Processed](#) section in the Using Payables Invoice to Pay guide – To understand the steps involved in creating invoices.

Access requirements

No new access requirements.

Intercompany Batch Reversals with Standard Credit Memos

Create Intercompany batch reversals that generate and automatically apply standard credit memos against the original receivable intercompany invoices. A new option is available to create and apply standard credit memos instead of on-account credit memo applications, to streamline the reversal process by eliminating the need for manual

application of credit memos. This feature helps customers meet varying global regulatory requirements and is available for both batch-based and multitier intercompany transactions.

On-account credit memo (negative receivable transaction types) previously required manual application to the original invoice during intercompany batch reversals. Standard credit memos instead reference and apply directly to the invoice, removing the manual step. For both batch-based and multitier transactions, a new option is provided to generate standard credit memos instead of on-account credit memos.

Enable the new option on the Manage Intercompany Receivables Assignment to generate standard credit memos as the negative receivable transaction type. If not enabled, on-account credit memos are generated for intercompany batch reversals. While creating intercompany reversals, you have the option to override the default setting for generating standard or on-account credit memos at the individual intercompany reversal level. This feature applies when the intercompany transaction type has invoicing enabled. It is supported for batch-based transactions, multitier reversals, and cross-charge reversals generated from document preparation.

Business benefits include:

- Eliminate manual application of credit memos, reducing processing time and operational effort.
- Improve accuracy by automatically applying credit memos to the correct invoices, minimizing data entry errors.
- Streamline intercompany reversal processing across batch-based and multitier transactions.
- Support consistent and auditable intercompany processing to help meet global regulatory requirements.

Steps to enable and configure

Use the Opt In UI to enable this feature. For instructions, refer to the Optional Uptake of New Features section of this document.

Offering: *Financials* No Longer Optional From: *Update 26C*

- Use the Opt In UI to enable this feature. For instructions, see the Optional Uptake of New Features section of this document.

Access requirements

No new access requirements.

Budget Entry Creation from Revenue for Control Budget

Assign a control budget when creating a budget from revenue using the Create Budget Entry from Revenue process. The assignment of a control budget aligns the expense budget scenario to a control budget when importing the budget into both Budgetary Control and General Ledger. This simplifies management of multiple budget scenarios by allowing assignment of revenue-derived budget amounts to an expense budget scenario based on the control budget's revenue funding rules.

Business benefits include:

- Adding the **Control Budget** parameter to the **Create Budget Entry from Revenue** process ensures that budget entries are created and updated only for the intended control budget and its corresponding budget scenario.
- This ensures each control budget is updated against the specific scenario when more than one control budget exists. Organizations can maintain proper alignment between **Control Budgets**, **Budget Scenarios**, and the **General Ledger**, reducing reporting inaccuracies, reconciliation issues, and downstream budget control errors.
- This enhancement gives users better control over budget processing in multi-control-budget environments.

Steps to enable and configure

You don't need to do anything to enable this feature.

Tips and considerations

A new parameter **Control Budget** has been added to the **Create Budget Entry from Revenue** process. This parameter is not required. Review any scheduled processes or scripts that automatically run this program.

Key resources

To learn more about the **Create Budget Entry from Revenue** process, see **Using Financials for the Public Sector: Automated Funding of Expense Budgets from Revenue**.

Access requirements

No new access requirements.

Attributes for Asset Addition Using ERP Integration REST API

Procure to Pay - Asset Acquisition, Maintenance, and Lease:

The “Transaction-addAsset” service of the ERP Integration REST API supports the following additional attributes in 26C, which can now be added during asset addition:

- P_IMPAIRMENT_RESERVE
- P_YTD_IMPAIRMENT

Business Benefits:

- Enables users to add assets along with impairment reserve and year-to-date (YTD) impairment values.
- Enhances process automation while significantly reducing manual effort.
- Improves operational efficiency and supports streamlined business processes.

Steps to enable and configure

Review the REST service definition in the REST API guides to leverage (available from the [Oracle Help Center](#) > *your apps service area of interest* > APIs & Schema). If you are new to Oracle's REST services you may want to begin with the Quick Start section.
