Receipt-to-Receipt Applications

You can apply an open receipt against another open receipt.

You apply a receipt against another open receipt to move funds between receipts. Open receipts include receipts that have either unapplied cash or on-account cash. You can then apply the resulting unapplied receipt balance to a transaction.

To use receipt-to-receipt applications, you must set up a clearing account under the Receivables activity Payment Netting to manage the offset of the one receipt against the other.

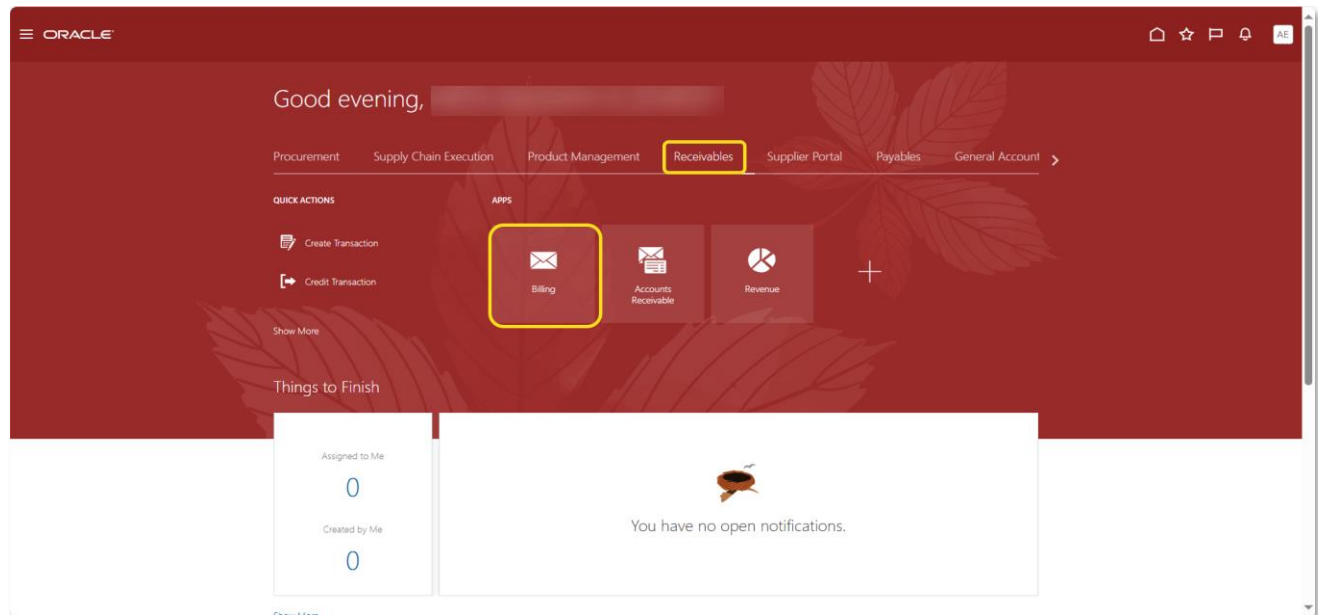

Both receipts in a receipt-to-receipt application must be in the same currency. If both receipts are in a foreign currency, the result of the receipt application may be an exchange gain or loss. The exchange gain or loss is realized on the target receipt at the time of receipt application. If you later adjust the conversion rate on either receipt, the accounting is rederived using the adjusted conversion rate.

You can unapply a receipt that was applied to another open receipt, provided that neither receipt is drawn negative by unapplying it.

Note: You must set up payment Netting Account in Receivables Activities

When you apply one receipt to another in Oracle Receivables, the system treats the application as a **reduction** of the available balance of the applied-to receipt.

- From accounting logic:
 - The receipt is a debit to *Cash* and a credit to *Customer Balance*.
 - When you apply a receipt **to another receipt**, Oracle shows the **applied amount as negative** because it is **offsetting or reducing** the balance of the target receipt.

So, the **negative sign doesn't mean money is lost**, it just represents that the amount has been **consumed/offset** by the application.

A screenshot of a software interface showing a window titled 'Accounting Lines: Receipt R2R_test-098'. The window has a header section with 'Ledger Primary Ledger', 'Date 31/03/2025', and 'Status Draft'. Below the header, there are tabs for 'View T-Accounts' and 'Detach'. The main content is a table with columns: 'Line', 'Event', 'Account', 'Class', and 'Accounted (SAR)'. The 'Accounted (SAR)' column is further divided into 'Debit' and 'Credit'. There are three rows of data.

Line	Event	Account	Class	Accounted (SAR)	
				Debit	Credit
1	Receipt Created	10.0000.00000.125210007.00000.000000000.00000	Remitted cash	2,000.00	
2	Receipt Created	10.0000.00000.111310000.00000.000000000.00000	Payment netting	1,500.00	
3	Receipt Created	10.0000.00000.125310000.00000.000000000.00000	Unapplied cash		3,500.00

Scenario

- You created Receipt A = 2,000
- You created Receipt B = 1,500
- Then you applied the smaller receipt (1,500) to the larger receipt (2,000).

Why the journal entry looks like this

In the screenshot, Oracle created:

- Debit Remitted Cash = 2,000
- Credit Unapplied Cash = 2,000
-

This happens because:

1. When you receive the 2,000, the system records it as cash collected (Remitted Cash).
 2. At the same time, it offsets that amount into Unapplied Cash until you apply it against a transaction (like an invoice) or another receipt.
-

Why the Applied Amount shows as negative

- In a *Receipt-to-Receipt Application*, Oracle does not create a new cash entry (because the money was already received).
 - Instead, it simply reduces the open balance of the target receipt.
 - To show this reduction, Oracle displays the Applied Amount as a negative number. It indicates that part of the larger receipt's balance is being “consumed” or “offset” by the smaller receipt.
-

In short

- The accounting entry you saw is normal: cash was received and placed into unapplied.
- The negative sign in the *Applied Amount* is not a loss, it just means the system reduced the available balance of the receipt you applied against.
- No extra cash entry is generated — it's purely an adjustment between receipts.

Go to the second Receipt

View Accounting

Accounting Lines: Receipt R2r2_test_8999

Ledger: Primary Ledger Date: 31/03/2025 Status: Draft

View: View T-Accounts Detach

Line	Event	Account	Class	Accounted (SAR)	
				Debit	Credit
1	Receipt Created	10.0000.00000.125210007.00000.000000000.00000	Remitted cash	1,500.00	
2	Receipt Created	10.0000.00000.111310000.00000.000000000.00000	Payment netting		1,500.00

Amount Due: -3,500.00 SAR * Applied Amount: 1,500.00

When you open the **second receipt** (the one you applied against the first one), Oracle shows the **Amount Due as negative (-3,500)**.

- The **negative Amount Due** means that this receipt itself does not represent an open receivable balance like an invoice.
- Instead, it is a *cash receipt* that is being used to offset another receipt. That's why Oracle treats it as a *credit balance* (hence the minus sign).

At the same time:

- The **Applied Amount = 1,500** shows how much of this receipt was used to apply against the first receipt.
- This way, Oracle balances both receipts by showing one side as **negative (credit)** and the other side as **positive (debit)**, with the **Payment Netting account** sitting in between.

◆ **In simple terms:**

- Receipt A: shows **Applied Amount = -1,500** (because you are applying it to *another receipt*).
- Receipt B: shows **Applied Amount = +1,500** (because it is being *offset by Receipt A*).

The system uses the **negative sign** to indicate that this is *not a receivable to collect*, but rather an *application between two receipts*.
