

Oracle Integrated Invoice Imaging Issues

MAY 2019

Oracle Integrated Invoice Imaging Solution Overview

Paper invoices are still prevalent in today's business world, prompting most organizations to implement some form of imaging capability for their Payables department, to help reduce the receipt-to-payment cycle and meet audit requirements. This involves implementing multiple point solutions with the following challenges:

Components from different vendors specializing in scanning, data extraction, storage and workflow, based on proprietary technology, require dedicated IT staff to set up, integrate, and maintain, resulting in higher implementation and maintenance costs.

Disparate platforms, operating systems, and release or certification cycles increase the risk of incompatibility and maintenance overhead. When the ERP system is patched, re-implementation of some or all components may even be required.

Given this a la carte selection process, the result is a disjointed, bolt-on solution footprint that is truly unique to each implementation and cannot leverage native ERP capabilities and efficiencies. Such implementations often rely on either custom user interfaces or direct import of raw data via open interfaces or both. Therefore completely bypassing native ERP transaction entry and validation.

Oracle is the only vendor in the market today offering a fully integrated invoice imaging solution that provides a seamless user experience, supporting the entire invoice lifecycle from scanning, recognition, and routing, to invoice entry, approval, and payment – all based on a unified security model. This end-to-end solution is certified and supported by Oracle on a common provisioning framework, with minimal setup and configuration required, thereby reducing the total cost of ownership.

Oracle Integrated Invoice Imaging

You can now use the Oracle Cloud Automated Invoice Processing Cloud Service solution to automate the invoice creation process including invoice lines. This improves processing time and user productivity, while reducing data entry errors and staffing requirements. Invoices are scanned or sent by e-mail for recognition and validation, and then appear directly in the Scanned Infotile of the Invoices work area for approval, accounting, and payment. Invoices that aren't fully recognized due to data or image quality are created as incomplete invoices. Users can review, correct, and complete these invoices manually.

Getting Started

Set up the Payables imaging solution using the following 3 steps.

Step 1 Confirm the designated e-mail accounts

Verify you have e-mail accounts, one for each pod within 20 days of signing up for the Automated Invoice Processing service.

Step 2 Set up the scanners

Set up the scanners to produce TIFF images with International Telegraph and Telephone Consultative Committee (CCIT) Group IV compression at 300 dpi. It is also recommended to use dynamic thresholding to produce a high-quality black and white image for best recognition rates.

Step 3 Send the invoices

Invoices in a printed physical format must be scanned and then sent by e-mail. Invoices in a digital format can be sent directly by email.

Confirm the digital invoices were sent and received to complete your imaging solution.

Below table depicts the steps that should be done prior to imaging go-live.

Pre-requisites	Responsibility	Steps
Ensure Ops team sends an email to customer with the email ids during implementation	Provisioning Team will Send an welcoming Packet email to customer with imaging emails.	No setup needed or reaching out to operations as standard wait time is 6-8 weeks for implementation.
Get the requirements of the type of suppliers that needs to be included/excluded and update the Imaging configuration file at the start	Customer needs to confirm what type of suppliers will be created. Implementation team will confirm if suppliers need to be excluded such as internal. Operations will do the action plan to exclude suppliers in OFR.	Customer must follow (Doc ID 2210541.1) and once completed create SR for Operations to do Step 2.
Get the PO format at the time of implementation	Customer needs to confirm if PO matched invoices created via scanning. Implementation team must work with customer to confirm PO format and create SR for operations to setup PO Format.	Customer must refer to (DOC ID 1987349.1) to confirm PO format and Operations to setup PO format in configuration file.If PO matched invoices not created, then disable PO recognition.
Implement Imaging Audit Report	Customer/Implementer to complete audit report setup steps and log SR if report setup/output needs review	Customer must follow (DOC ID 2210741.1) and Implementation team must confirm Audit setup in Windows VM with Operations
Special characters to be retained in the invoice number.	Customer to specify special characters to be retained in invoice number apart from 'hyphen' which is retained by default.	Implementer must follow (DOC ID 2245609.1) to confirm unique character and SR must be created so Operations can setup. Add special characters in Designer.
Disable line recognition for OCR	Customer must confirm if Line Level imaging Recognition is needed and if not Implementation team must create SR with support. We can disable line level recognition for either ALL invoices or non-PO invoices	SR must be created for Line Level imaging to be disabled following (DOC ID 1987349.1)
Get the requirements of the invoices such as recognition of Invoice lines etc.	Customer must confirm if Line Level imaging Recognition is needed and if not Implementation team must create SR with support	SR must be created for Line Level imaging to be disabled following (DOC ID 1987349.1)
Invoice image is missing in the Invoice approval notification	Customer must confirm attachment size and support need to confirm Notification Attachment Size setup	Customer must Create SR with Invoice Approval Module

Below table shows common issues that the customer should take before go-live.

Do's and Don'ts	Process	Responsibility
Communicate to customer that the resolution should be 300 dpi.	Set up the scanners to produce TIFF images with International Telegraph and Telephone Consultative Committee (CCIT) Group IV compression at 300 dpi	Customer
Communicate to customer that the custom email is not allowed.	Communication	Implementation Team
Its recommended not to enter BU while running import process	Its recommended to leave BU blank while running import process	Customer
Mark Suppliers as Internal or Intercompany to avoid incorrect supplier Recognition.	Define appropriate set ups	Customer
When Scanning Multiple Invoices in 1 PDF please make sure to use a clean blank paper in between each invoice such that blank page separator is less than 3 KB.	Customer to Use a Blank Clean Sheet of Paper for a page Separator when Scanning multiple Invoices into 1 PDF	Customer
If Sending Supporting Documentation please Use a Supporting Documentation Page after invoice Page	Customer to Use Support Document Separator from Doc ID 2017464.1	Customer
Make sure that PO information has been created before sending images for PO Matched invoices	Customer to confirm and create PO in Environment prior to Testing to avoid incomplete invoice	Customer

Training	Document	Responsibility
Set up of Imaging	Doc ID 1966280.1	Customer/Implementation team/Provisioning
Ability to derive the PO line number for invoice matching based on the Supplier Item number	Doc ID 2285235.1	Customer
PO Identifying number field is disabled on Imaging Invoice	Doc ID 1987349.1	Customer
Setup Imaging Audit Report in BI	Doc ID 2210741.1	Customer/Implementation team
Know how to make setup roles for users to view Images on the Invoice UI	Doc ID 2366622.1	Customer

Provisioning FAQ's:

1. How do I get the cloud e-mail account where I need to send the scanned invoices?
The e-mail account is in the welcome kit mail that was sent when the imaging environment was provisioned. If you do not find the welcome e-mail, log a Service Request for the invoice e-mail address.
2. How do I find an invoice sent to a designated e-mail account but can't be found under the Scanned infotile?

Follow these troubleshooting steps:

1. Check if the import process was scheduled.
 - If it wasn't scheduled, follow the [instructions](#) on how to schedule the process to import invoices on a regular basis. It's recommended that you schedule the process to run every hour. After scheduling it, you can expect to see invoices in the Scanned Infotile after about 1 hour from sending the invoice by e-mail. If you submit the import process right away, the estimated time to see the invoice is about 20 minutes.
 - If the process was scheduled but ended with error because of not setting up a default business unit for the user who submitted the process, follow the [instructions](#) to set it up. Every user needs to have a default business unit set up.
2. If the import process was scheduled and ran successfully, check if the invoice is available when searching from the Manage Invoices task. If it's available, review the incomplete invoice routing rule and follow the [instructions](#) to make the necessary corrections.
3. If the invoice isn't available when searching from the Manage Invoices task, follow the [instructions](#) to check if the invoice image is present in Image Processing Management. If it isn't present, check if your image quality is 300 dpi.

E-mail Related FAQ's

3. Can multiple invoices be included in one e-mail?

Yes. The application supports multiple ways to include invoices in an e-mail:

- Single page invoice in one attachment
- Multipage invoice in one attachment
- Multiple invoices in one attachment
- Single and multipage invoices in multiple attachments

NOTE: The total size limit of attachments is 10 MB per e-mail. Attachment file name should be less than 69 characters (excluding file extension)

Recommendation:

Organize invoices within the attachments in the following way. If you have:

- Single page invoices in an attachment, insert a blank page between invoices.
- More than one multiple page invoice in an attachment, insert a blank page between the invoices.
- Both single and multiple page invoices in an attachment, insert a blank page between invoices.

4. Can I include supporting documents with an invoice?

Yes. You can add supporting documents to an invoice. To ignore the supporting documents during data recognition, you can separate the invoice and supporting documents with a designated separator page.

5. How do I reconcile between the invoice images e-mailed to the designated imaging e-mail address and the invoices created in the payables system?

NOTE: Refer to note [2210741.1](#) and install the imaging auditability report.

Recognition FAQ's

6. What invoice types are recognized?

Invoice types that are recognized in the imaging solution are standard Invoices and Credit Memos. For an invoice to be recognized as a credit memo, the image must contain the word Credit Note, Credit Memo or have a negative balance.

7. How is currency identified on the invoice image?

Both currency symbol and short code is used to recognize the currency on the image. If the imaging solution cannot recognize the currency from the invoice image then the invoice currency setup at the supplier site (if not set at site then the invoice currency at BU options) is used for creating the invoice.

8. Can I scan an invoice in different currencies?

Yes, the imaging solution is capable of recognizing multiple currencies when properly formatted on the invoice image.

9. How do special characters on the Invoice number get recognized?

Log a service request with support to update the configuration settings to recognize the special characters.

10. Can I use other document types such as pdf and jpg?

Yes, the following image formats are supported: .TIF; .TIFF; .PNG; .JPG; .DOC; .DOCX; and .PDF.

11. Why are we using e-mail to get the image to the imaging solution? Can we use a scanner or fax?

Cloud customers are given an e-mail address which they send their invoices to be processed. An on premise customer would have more options such as direct scanning or fax.

12. What are best practices to be followed for high image recognition rate?

- Image file with multiple 1 page invoices should be separated by blank page separator of size 3KB or less.
- Image Quality :
 - Set up the scanners to produce TIFF images with International Telegraph and Telephone Consultative Committee (CCIT) Group IV compression at 300 dpi. If the scanner supports dynamic thresholding to produce high quality black/white images these give the absolute best quality for scanned images in TIFF.
 - Avoid hand written content and stamp marks as it impacts recognition rate.
 - Invoice Image should have supplier address on it. Lines section should have proper column headings
 - Supplier address defined in Cloud
 - Supplier module should exactly match with the address printed on the invoice.
 - Non invoices such as cab receipts do not get recognized.
 - If you are not using PO matched invoices, log a service request to disable PO recognition for imaging.
 - If you are using PO matched invoices then log a service request to update the image configuration with the PO formats used in the Purchasing module.
 - Employees should not be created as suppliers in Cloud Applications. If the employees are already created in Cloud Application either they need to be deactivated or log a service request to exclude certain supplier types. This exclusion will work only if all employees are assigned same supplier type.
 - Specify the invoice currency code in either or both the Manage Invoice Options page and supplier sites that help in defaulting of the invoice currency.
 - The invoice line should be in tabular format otherwise the recognition rate is not good.
 - If the invoice runs into several pages and includes supporting documents (such as e-mail, notes, and contracts) then use the supporting document feature ([Doc ID 2017464.1](#)) or log a service request to update the imaging configuration to recognize the additional pages..
 - Verify the service provider or internal resource do not send duplicate invoices. If duplicate invoices are sent to the imaging server, the latter would be imported as Incomplete and be identified as a duplicate invoice. Users must review and delete them. • Do not send images in .xls or .xlsx format. Supported invoice formats are listed in recognition related FAQ's section.

Note: Below are examples of sample invoices.

Sample invoice for good recognition of attributes.

P.O. Number	Terms	Rep	Ship	Via	F.O.B.	Project
	Due on receipt		4/30/2013	Hand delivery

Supplier Related FAQ's

13. How is the supplier recognized from the invoice image for an unmatched invoice?

Suppliers and their addresses configured in Oracle Cloud are extracted to the imaging solution that has the vendor pool information. The imaging solution reads the address from the invoice image and tries to find the address in the vendor pool extract. The address that closely matches the address in the application is recognized as the supplier. It is very important that customers configure the address of the supplier correctly in order for the application to match with the address on the invoice image.

14. What should be done for an intercompany supplier whose address appears as a bill-to address on the invoice image?

Generally Payables invoices have 2 addresses where one is the physical location of the supplier and the other is the address of the bill-to party. Some customers configure suppliers with a bill-to address, for suppliers created for intercompany transaction purposes. It is recommended that the address of the intercompany supplier is set differently from the bill-to address as the intercompany supplier address is generally not used for any specific purpose. The regular supplier address is used for sending checks and other reports whereas intercompany suppliers are not used for such purposes. Having a different address for an intercompany address does not impact any business flow.

15. What if 2 suppliers reside in the same address?

The addresses for both must be accurate and defined as unique. For example: If both suppliers are residing in the same building, but on different floors the floor numbers must be indicated on the invoice image and the same must also be captured in the invoice image **NOTE:** The correct supplier may not get recognized if both suppliers have the same or similar address. Should this be the case, the user must change the supplier address manually. It is uncommon to have multiple suppliers residing at the same address.

16. Why isn't new supplier information recognized after adding them?

To be recognized, any new supplier must be created in the application at least a day before the invoice is to be created. Also the pay site flag should be enabled on at least one supplier site.

For suppliers that typically have purchase orders created, the supplier is added prior to the invoice being created. In the case of unmatched invoices, you must create the suppliers at least a day in advance. This ensures you are able to scan and create the invoices automatically with the supplier information being recognized.

If you need to scan the invoice image immediately after creating a supplier, you can create a service request for manual supplier synchronization after the supplier is created. Once the supplier synchronization is complete, the supplier information is recognized when you scan and create the invoice. If the supplier still cannot be recognized after supplier synchronization, check the supplier site address setup.

NOTE: The application recognizes the supplier by comparing the supplier site address with any addresses shown on the invoice image.

Matched and Unmatched Invoices FAQ's

17. What should be the PO numbering format?

It is strongly recommended to have an alphanumeric PO number. For example: If a customer has configured the PO number to be a 7 digit number, there can be multiple numbers on the invoice image such as phone number, tax region number, shipping reference number, supplier order numbers, or IBAN number that consist of 7 digits. In this case, the imaging solution may wrongly recognize such numbers as the PO number. However, if the PO number has been configured with an alphanumeric number, then recognizing some other number as the PO number is greatly reduced.

18. Why are lines not getting recognized for unmatched invoices?

There is a likelihood that some number on the invoice image is being recognized as the PO number. Check for any kind of colored border on the identifying PO field in the invoice UI. If yes, then it means that some number on the invoice image is getting recognized as PO number. For such an issue, log a service request to update the configuration of PO numbering in imaging setup.

19. What are the best practices recommended for me if I am not using Oracle Cloud Procurement?

You must log a service request to update the configuration setting of imaging to turn off PO recognition. This will ensure that none of the fields on the invoice image get recognized as PO numbers. Additionally, check your business process to determine whether the business unit information is provided by the user when sending the invoice image or they want it to be defaulted from the users default org profile option. Depending on the decision, make the required setups.

20. Why do I see the Identifying PO field highlighted in orange on the Invoice page when an unmatched invoice is sent?

The application is set up to recognize a purchase order on every invoice. The recognition is based on the configuration defined for the purchase order in the configuration file of the imaging server. If any formats matching the defined configuration are found, but the purchase order doesn't exist in the application, the Identifying PO field is highlighted in orange for your review. You can create a service request to update the default settings based on your business requirements. If you don't have any matched invoices, submit a service request to disable purchase order recognition.

NOTE: The default purchase order number setting is 3 characters + 6 digits. Ex: ABC123456.

RECOMMENDATION: The use of alpha numeric PO number formats is very highly recommended in order to distinguish the PO number from other numbers on the invoice such as VAT Numbers, ZIP codes (US invoices), Shipping reference numbers, etc.

21. Why aren't the invoice lines matching to the purchase orders for invoices that include multiple purchase order numbers?

Make sure each line of the invoice references its respective purchase order so that the relevant PO number is reflected on each invoice line. If the invoice line does not have a PO number, it will not be matched. Log a service request to ask support to enable multiple PO recognition.

Other FAQ's

22. How do I scan and send utility bills?

Utility bills are generally posted to a single account with a single invoice line. However the utility invoices run into several pages as they have detailed itemization. The recommendation for utility bills is to use the manual approach to create the invoice and add the scanned image using the attachments functionality. This is because reading the detailed itemized lines does not serve any purpose and the recommendation is to create the invoices manually.

23. What is the file size that is allowed?

File size should not exceed 10 MB per attachment.

24. Is there a way to review all my scanned invoices in the scanned queue?

There is a profile option on incomplete invoices. When this option is turned on then all the images appear as incomplete status and appear in the scanned queue where user can review each invoice and then mark them as complete.

25. Why is the tax information missing from the invoice page when the paper invoice has a tax amount?

Tax information isn't recognized from the invoice image. It's calculated automatically by a robust tax engine with predefined tax rules. If the tax is missing from the invoice page, check your tax rules setup.

For the list of attributes that can be recognized, see [Advanced Topics: Attributes Recognized by Invoice Imaging](#).

26. Does it matter what I enter as the e-mail subject when sending invoice?

In general it doesn't matter what you enter as the e-mail subject except you must not include the underscore (_) in the subject because the application treats that symbol as your intent to populate routing attributes on the invoice.

For details on routing attributes, see Advanced Topics: [Routing Attributes 1 to 4](#).

27. What if I want to route incomplete invoices based on attributes not specified in the invoice?

The application provides 4 additional routing attributes that you can use to define routing rules according to your business requirements. For details on routing attributes, see Advanced Topics: [Routing Attributes 1 to 4](#).

28. Why do I see a TIFF format attachment in the application when I sent it as a PDF invoice?
The application supports invoices with the following file extensions: *.tif, *.tiff, *.png, *.jpg, *.doc, *.docx, and *.pdf. However to produce the best recognition results, the application converts the other document types into the TIFF format.
29. Why do I see a black and white invoice images in the application when I sent a color image invoice?
The application converts the color image invoice into a black and white one. The black and white image provides optimal optical character recognition accuracy and a reduced image size.
30. Why do I see scanned invoices that aren't supposed to be routed to me based on the defined routing rules?
The defined routing rules are used to route **incomplete invoices**, which are invoices created from an invoice image that have invalid or missing data to users for review and completion. These invoices can be seen only by the user to whom the invoices are assigned. However the invoices with a status of **Not validated** or **Needs revalidation** appears in the Scanned infotile for all users based on their business unit security.
Users with Accounts Payable Supervisor and Accounts Payable Manager job role can see all the scanned invoices. They are categorized into the following aging buckets: 0-7 days, 8-14 days, and 15+ days.

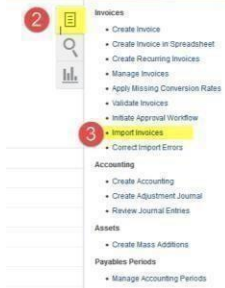

31. Why can't I delete invoice lines from some of the scanned invoices?
If the invoice has a status of **Incomplete**, you can delete the line by selecting it and clicking **Delete**.
If the invoice has a status of **Not validated**, you cannot delete an invoice line by default because tax is calculated. You can follow the [instructions to disable tax calculation during import process](#) or you can cancel the line.
32. Can I update or delete invoices in the Webcenter Image Process Management (IPM)?
It is recommended that user access IPM only during the active testing phase for troubleshooting purposes. At all other times, they should access the image invoices in the application only. In addition, updating or deleting invoices in IPM has no effect on those image invoices in the Payables application.

Advanced Topics

How to Schedule the Import Payables Invoices Process

1. Sign in to the application and navigate to the Invoices work area.
2. Click the tasks icon to open the panel drawer.
3. Click on Import Invoices.

4. Enter the **Ledger** and **Business Unit** (optional), and select Invoice Image as the **Source**.
5. Click **Advanced**.

A screenshot of the 'Submit Request' form. The 'Parameters' tab is selected. The 'Business Unit' field is set to 'US1 Business Unit', the 'Ledger' field is set to 'US Primary Ledger', and the 'Source' field is set to 'Invoice Image'. These three fields are highlighted with a yellow background and a red circle with the number 4. Other fields include 'Import Set', 'Invoice Group', 'Hold', 'Hold Reason', 'Accounting Date', 'Purge', and 'Summarize Report'. The 'Advanced' button is highlighted with a yellow background and a red circle with the number 5.

6. Select the Schedule tab and enter the frequency. The recommended frequency is 1 hour.
7. Click **Submit** to complete the scheduling.

A screenshot of the 'Submit Request' form. The 'Schedule' tab is selected. The 'Frequency' field is set to 'Hourly/Minute'. The 'Every' field is set to '1', the 'Hour(s)' field is set to '0', and the 'Minute(s)' field is set to '0'. These three fields are highlighted with a yellow background and a red circle with the number 6. Other fields include 'Start Date', 'End Date', and 'Customize Times'. The 'Submit' button is highlighted with a yellow background and a red circle with the number 7.

Note: The application requires an end date so make sure it is far enough out.

In the Test phase, to import the invoices immediately for testing, you can submit the process immediately by selecting: As soon as possible.

Business Unit Defaulting

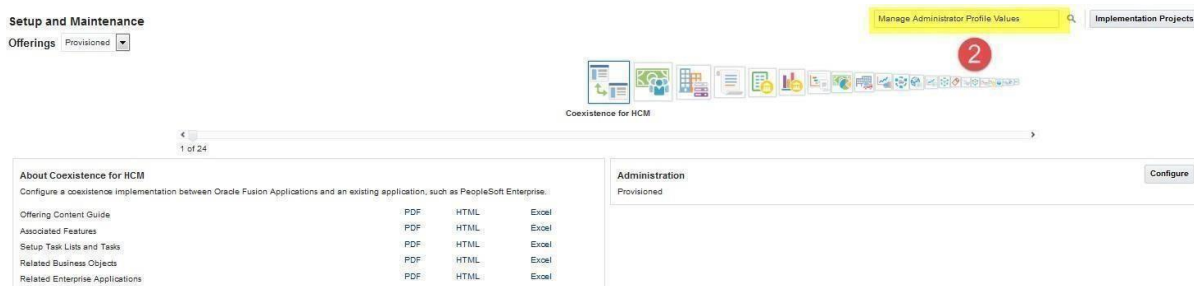

For matched invoices, business units default from the purchase order.

For unmatched invoices:

- The business unit defaults from the business unit assignment of the supplier site that is set as the pay site.
- If the supplier site cannot be determined from the image, or no pay site is defined, or the site has more than one business unit assignment, then the business unit defaults from the user's Default Business Unit profile option.
- If you specified the business unit in the e-mail subject, then the business unit from the e-mail is stamped on the invoice, overriding all other defaulting logic.

Follow these steps to set the Default Business Unit profile option for a user:

1. Sign in to the application and navigate to the Setup and Maintenance work area.
2. Search for the Manage Administrator Profile Values task and click the **Search** icon.

3. Click on the Name link to open the Manage Administrator Profile Values page.

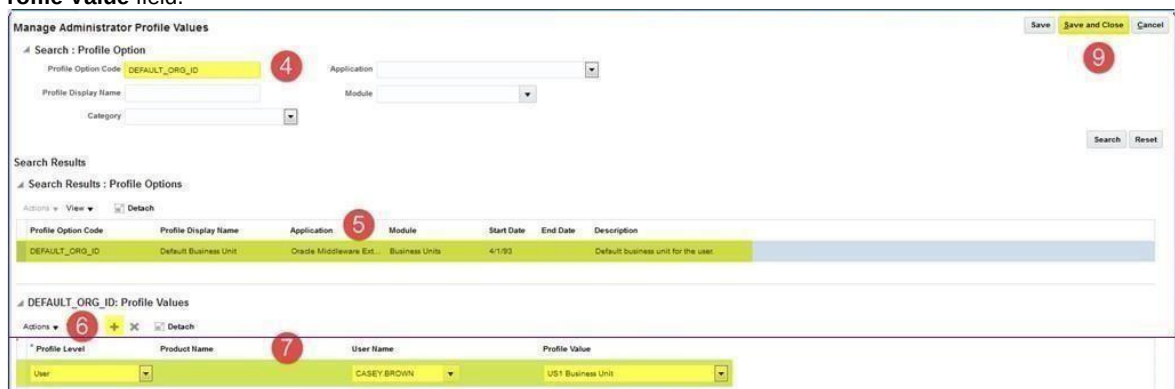

4. In the **Profile Option Code** field, enter DEFAULT_ORG_ID (case sensitive) and click **Search**.

5. In the Search Results: Profile Options section, click the DEFAULT_ORG_ID row.

6. In the DEFAULT_ORG_ID: Profile Values section, click the **New**  button to add a row.

7. Select the **Profile Level** of User, enter the **User Name** that will process the invoices, and select the default business unit in the **Profile Value** field.

8. Repeat steps 6 and 7 to set up a default business unit for all of the users that process invoices.

9. Click Save and Close when you have completed the setup for all users.

Follow these steps to enable and use business unit defaulting from the routing attribute:

10. Sign in to the application and navigate to the Setup and Maintenance landing page.
11. Search for the Manage Payables Lookups task.

12. Click the Name link to open the Manage Payables Lookups page.

The screenshot shows the top of the Oracle application interface. At the top right, there is a search bar with the text "Manage Payables Lookups" and a magnifying glass icon. Below this is a horizontal navigation bar containing various icons for different application modules. The "Financials" icon, which depicts a building with a dollar sign, is highlighted with a blue border and the word "Financials" is written below it.

13. In the Lookup Type field, enter `ORA_IMAGING_ROUTING_ATTRIBUTES` and click **Search**.
14. In the Financials Generic Lookup Type section, select the check box in the **Enabled** column for the `ORA_BUSINESS_UNIT` lookup code.

The screenshot displays the "Manage Payables Lookups" page. The "Search" section at the top has a "Lookup Type" field containing "ORA_IMAGING_ROUTING_A" with a red circle "4" next to it. Below this is a "Search Results" section showing a table with one row: "ORA_IMAGING_ROUTIN..." with a "Meaning" of "Mapping of Routing Attributes to Invoice". Below the search results is the "Financials Generic Lookup Type : ORA_IMAGING_ROUTING_ATTRIBUTES" section. It contains a table with columns: "Lookup Code", "Reference Data Set", "Display Sequence", "Enabled", and "Start Date". The first row is "ORA_BUSINESS..." with "Common Set" as the reference data set, and the "Enabled" checkbox is checked, marked with a red circle "5". The second row is "ORA_ROUTING..." with "Common Set" as the reference data set, and the "Enabled" checkbox is unchecked.

15. Click **Save** and the setup is complete.
16. Compose an e-mail and specify the business unit ID in the subject as routing attribute 1, which is the string that follows the first underscore sign.

The screenshot shows an email composition window. The "To:" field contains "FusionFINCloud-Invoices-(POD)-1@workflow.mail.us2.cloud.oracle.com;". The "Cc:" field is empty. The "Subject:" field contains "AdvCorp Invoice_300000046987012" with a red circle "7" next to it. The "Attached:" field shows a PDF file named "ADV Corp Jan-16 Invoice.pdf (15 KB)".

17. If you do not know the business unit ID, you can find the ID using the **Manage Business Unit** task under Financials Setup.

The screenshot displays the "Manage Business Units" page. The "Search" section at the top has a "Name" field containing "US1" and a "Manager" field. Below this is a "Search Results" section showing a table with columns: "Name" and "BusinessUnitId". The first row is "US1 Business Unit" with "300000046987012" as the BusinessUnitId. The second row is "US2 Business Unit" with "300000087957781" as the BusinessUnitId. A red circle "8" is placed next to the "BusinessUnitId" column header.

How to Disable Tax Calculation during Scanned Invoices Import Process

By default, tax is calculated during the scanned invoices import process. When a scanned invoice is imported with no exception, because tax is calculated, the invoice lines cannot be deleted. Follow these steps to disable the automatic tax calculation during scanned invoice import process:

1. Sign in to the application and navigate to the Setup and Maintenance work area.
2. Search for Manage Profile Options and create the new profile option task.

3. Create the AP_IMAGING_DISABLE_TAX (case sensitive) profile option with the following information, click Save and Close.

Profile Option Code: AP_IMAGING_DISABLE_TAX

Profile Display Name: Disable Imaging Tax Calculation

Application: Payables

Module: Payables

Description: Disable auto calculate tax for imaging invoices

Start Date: 1/1/01 (you can specify another preferred start date)

Create Profile Option

Profile Option

* Profile Option Code AP_IMAGING_DISABLE_TAX

* Profile Display Name Disable Imaging Tax Calculation

* Application Payables

* Module Payables

Description Disable auto calculate tax for imaging invoices

SQL Validation

* Start Date 1/1/01

End Date

4. Check the **Enabled** and **Updateable** checkbox at Site level, click Save and Close.

Configuration of Routing Rules

An incomplete invoice is an invoice created from an invoice image that has invalid or missing data. By default, incomplete invoices are routed to all users with the Accounts Payable Specialist and Accounts Payables Supervisor job roles for review and completion. For Accounts Payables Supervisor and Manager, these incomplete invoices appear on the Scanned infotile and are grouped by creation date.

If you need to route incomplete invoices based on other rules, you can modify the routing rule or add new routing rules based on available invoice attributes using the Approval Management extensions (AMX) of the Oracle SOA Suite and Oracle Human Workflow. The Oracle Business Process Management (BPM) Worklist application provides the interface to administer the rules.

A user who belongs to the Financial Application Administrator job role is a BPM Worklist Administrator and can access the rules in the BPM Worklist application. The navigation to access the BPM Worklist applications is as follows: **Navigators - Setup and Maintenance**. Then the user can directly search for **Manage Task Configurations for Financials** task through the search pane on the Setup and Maintenance landing page.

The predefined FinApIncompleteInvoiceHold task includes the task and rule settings for routing incomplete invoices. Task settings include assignment, routing, expiration, and escalation policies. Rules settings include routing, modification, and substitution rules.

Predefined Incomplete Invoice Routing Rule

The FinApIncompleteInvoiceHold task includes a rule set called IncompleteInvoiceRuleSet. This rule set includes a rule called JobRoleAssignmentRule. This rule is preconfigured to route incomplete invoices to users with the Accounts Payable Specialist and Accounts Payable Supervisor job roles. The following table lists the predefined settings for the rule JobRoleAssignmentRule:

Field	Value	Description
Condition	1 is 1	To use other invoice attributes, select from the condition browser.
List Builder	Resource	Determines the resource to which the invoice is routed.
Response Type	Required	Indicates that the routing notification requires a response.
Participants	Groups: "AP_ACCOUNTS_PAYABLE_SPECIALIST_JOB, AP_ACCOUNTS_PAYABLE_SUPERVISOR_JOB",	Identifies the participant to whom the invoice is routed.
Rule Name	"JobRoleAssignmentRule"	Identifies the approval reason to display in the approval history diagram.

Modify Existing Routing Rule

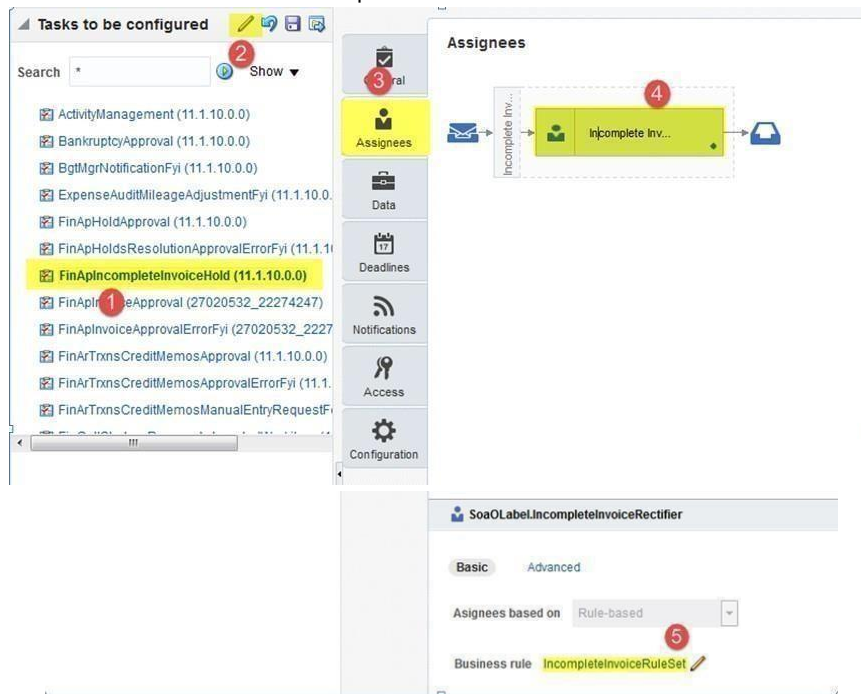

Rule sets are a collection of related rules. To modify the existing routing rule sets:

1. On the Assignees tab, select the rule set to modify.
2. Click the **Edit task**  icon in the **Tasks to be configured** pane.
3. Add, modify, or delete the rules for the rule set.
4. Click the **Save** icon in the **Tasks to be configured** pane to save the changes.
5. Click the **Commit task**  icon in the **Tasks to be configured** pane to activate the changes.

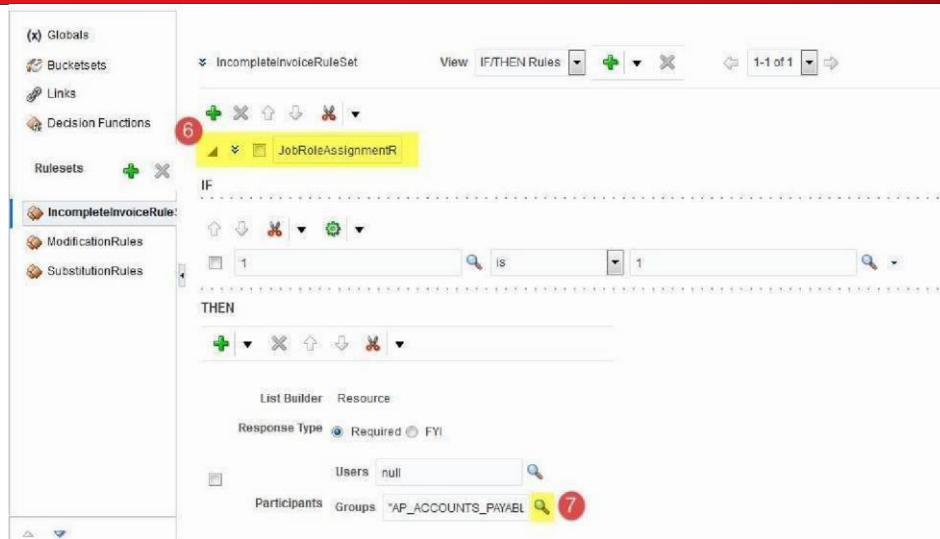

To undo changes, click the **Reset**  icon.

Here is an example of how to modify a rule set to route incomplete invoices to a specific user group, starting from the Task Configuration page in the BPM Worklist:

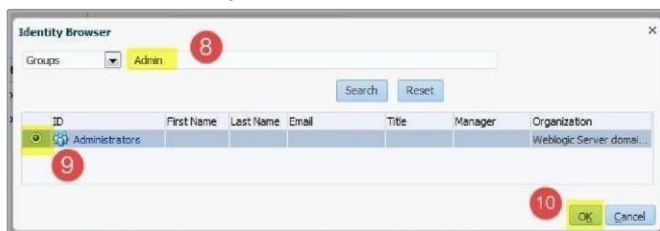

1. Select the FinApIncompleteInvoiceHold task.
2. Click the **Edit task** icon to edit the rule.
3. Select the Assignees tab.
4. Click IncompleteInvoicePayablesUser.
5. Click on the business rule IncompleteInvoiceRuleSet.

6. Click on the **Expand** icon to expand the existing JobRoleAssignmentRule.
7. Click on the **Search** icon next to the **Groups** field.

8. Search for the group that you want to use.
9. Click the radio button to select the group.
10. Click **OK** in the Identity Browser window.

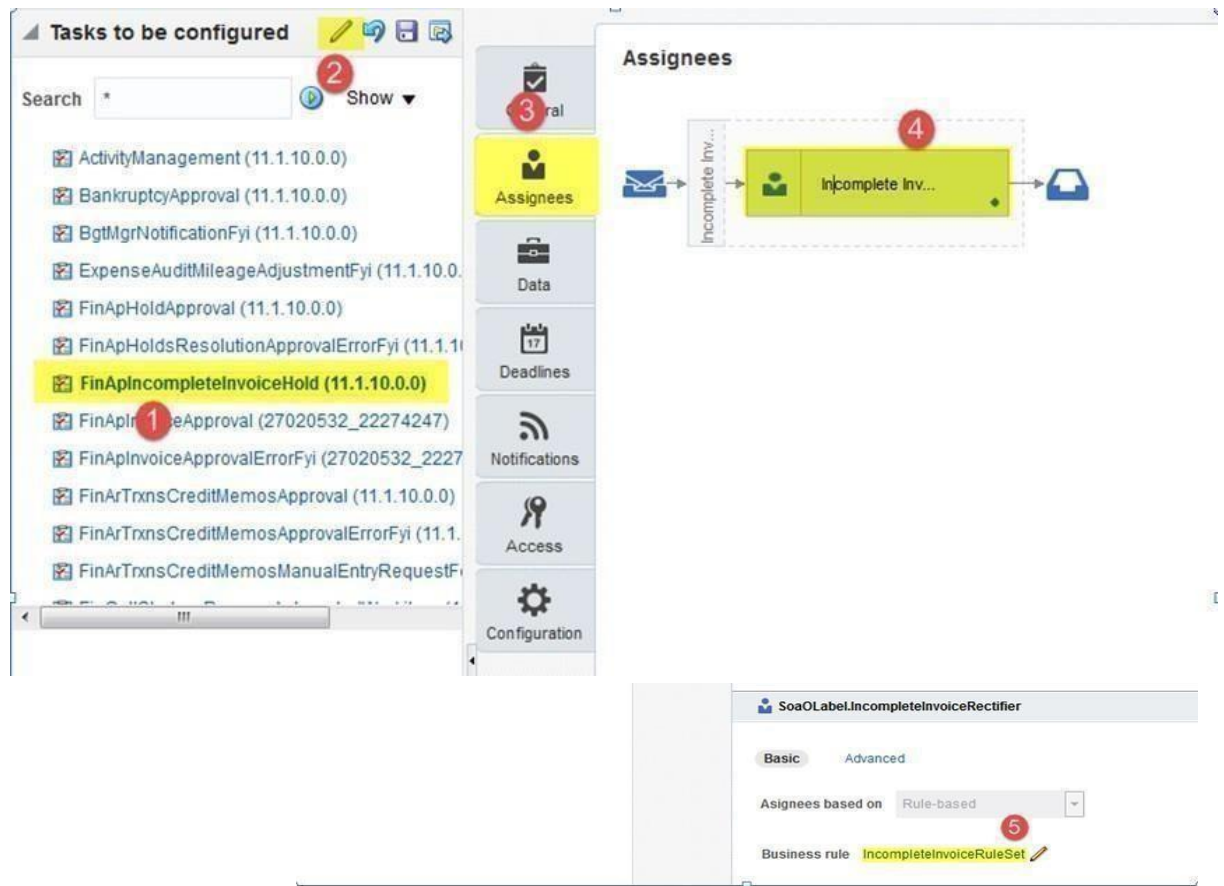

11. Validate the rule to ensure that there are no errors in the rule definition.
12. Save and commit the task to ensure that the new rule is functional.

Add New Condition to Existing Routing Rule to define a condition:

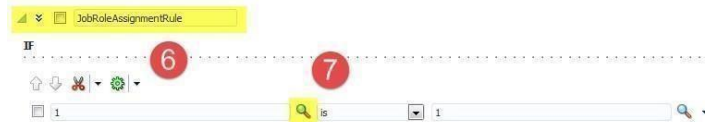

1. Select a value from the list of values in the left-most condition field in the IF section. The Condition Browser window appears.
2. In the Condition Browser window, open a view object (folder).
3. Select the attribute to use as criteria.

You can also add multiple conditions to existing routing rules. Here is an example of how to route invoices classified as Urgent using Routing Attribute 1, starting from the Overview page in the BPM Worklist:

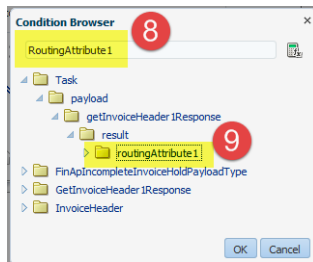

1. Select the FinApIncompleteInvoiceHold task.
2. Click the **Edit task** icon to edit the rule.
3. Select the Assignees tab.
4. Click IncompleteInvoicePayablesUser.
5. Click on the business rule IncompleteInvoiceRuleSet.

6. Click on the **Expand** icon to expand the existing JobRoleAssignmentRule.
7. Click the Left Value search icon to open the Condition Browser window.

8. In the Condition Browser window, search for RoutingAttribute1.
9. Drill down from the Task folder to find RoutingAttribute1, select it and click **OK**.

10. Click on the Right Value search icon to open the Condition Browser window.
11. Check the **Constant** check box in the bottom of the Condition Browser window.
12. Enter the value **Urgent**, then click **OK**.
13. Validate the rule to ensure that there are no errors in the rule definition.
14. Save and commit the task to ensure that the new rule is functional.

How to Access Image Process Management

1. Sign in to Image Process Management by using the Payables user account, which is the account with the Account Payables Specialist, Account Payables Supervisor, or Account Payable Manager predefined job role. Here is an example of an access link: <https://xxxx-test.fs.us2.oraclecloud.com/imaging/faces/Pages/Welcome.jspx>
2. Where xxxx is the name of your cloud service instance.
3. Click the Payables Invoice Search task.
4. Enter search Criteria and click **Search**.
4. Check if the invoice is present in the search results.

Attributes Recognized by Invoice Imaging

The invoice imaging solution is configured to recognize the following invoice attributes:

Level	Attributes
<i>Invoice header</i>	Invoice type
	Business unit
	Identifying purchase order number
	Invoice number
	Invoice date
	Supplier
	Supplier site
	Invoice currency
	Invoice amount
	Freight amount
	Routing attributes 1 to 4
<i>Invoice line</i>	Line number
	Purchase order number
	Purchase order line
	Purchase order schedule
	Item description
	Invoiced quantity
	Unit of measure
	Unit price
	Line amount

In addition, the default configuration:

- Determines the purchase order lines that individual invoice lines should be matched.
- Prorates freight to all item lines.
- Calculates tax based on Oracle Cloud Tax setups, not on the tax codes and amount specified on the invoice image.

Routing Attributes 1 to 4

The imaging solution can support up to four attributes in an e-mail subject, which can be recorded on the invoice or used to route the incomplete invoices to accounts payable personnel for review and completion. Use the underscore (_) as a separator to indicate the start of routing attribute information. Each attribute can contain up to 40 characters by default.

For example, if you have a specific business requirement to record categories on the invoice, such as invoice priority, supplier category, manufacturing plant number, storage bin number, you can specify the categories in the e-mail subject.

This table lists the categories, their possible values, and how they are mapped to Routing Attributes 1 to 4.

Routing Attribute	Category	Value
Routing Attribute 1	Invoice priority	Regular, Urgent
Routing Attribute 2	Supplier category	Regular, Supply chain related
Routing Attribute 3	Manufacturing plant number	Plant-1, Plant-2, Plant-3
Routing Attribute 4	Storage bin number	Bin#1, Bin#2, Bin#3

A supplier sends an invoice with the e-mail subject: **Invoice-1234 attached**. The imaging specialist reviews the e-mail and provides additional routing information in the e-mail subject. The revised e-mail subject is: **Invoice-1234 attached Urgent Supply chain related Plant-1 Bin#1**. Also please note that Routing Attribute 5 is reserved for image auditing purposes and will not be used for routing incomplete invoices.

You can also use routing attribute 1 to manually record the business unit if your supplier sites have multiple business unit assignments. For details on defaulting business unit based on routing attribute 1, see [Business Unit Defaulting](#).

Tips

1. Use the Firefox browser. Chrome V45 and newer have removed the 'NPAPI' Plug-in support. This is the technology used to display the images.
2. Make sure that you use an image in the supported format. Supported formats are:
 - a. .TIF
 - b. .TIFF
 - c. .PNG
 - d. .JPG
 - e. .DOC
 - f. .DOCX
 - g. .PDF
3. There is lag time between the time a supplier is created and imaging will begin recognizing invoices for that supplier. Imaging imports the suppliers and their site/addresses from Cloud Financials or Cloud Procurement once daily. The imaging server imports the supplier information in order to have a local database of active suppliers to allow for faster recognition. This usually occurs at 9pm local server time so if you are adding suppliers to test with prospective customers in order to demonstrate imaging using their suppliers and invoices, you must wait a day from the time you enter the supplier into Cloud and e-mailing invoices to imaging. If you cannot wait a day, log a ticket after creating the supplier asking to have the synchronization process run immediately as that can be done. For a live customer though, they should wait the 24 hours.
4. Imaging solution uses supplier address for identifying suppliers. This means that in order for the supplier on the invoice to match up with the supplier in Cloud Financials or Cloud Procurement, the site address should match EXACTLY with the address on the invoice.

Common Misconceptions

1. Automated Invoice Processing has a capacity to Learn and supports Supervised Learning – **THIS IS NOT TRUE** – Cloud Payables Automated Invoice Processing service does not support Supervised Learning.
2. Customers can change or add to the attributes that imaging will recognize. **This is not the case.** Imaging only supports the attributes below and this cannot be altered in any way.
 - a. Invoice Header Attributes
 - i. Invoice Type
 - ii. Business Unit
 - iii. Identifying Purchase Order Number
 - iv. Invoice Number
 - v. Invoice Date
 - vi. Supplier
 - vii. Supplier site
 - viii. Invoice Currency
 - ix. Invoice Amount
 - x. Invoice date
 - xi. Freight amount
 - xii. Routing attributes 1-4
 - b. Invoice Line Attributes
 - i. Line number
 - ii. Purchase order number
 - iii. Purchase order line
 - iv. Purchase order schedule
 - v. Item description
 - vi. Invoice quantity
 - vii. Unit of measure
 - viii. Unit price
 - ix. Line amount
3. You cannot change any invoice information in the Imaging Process Monitor (IPM). IPM is available to troubleshoot the imaging process but is static information. Any changes made in IPM will not be reflected in Cloud Payables.
