1. Create Customer

You must first go to **Manage Business Unit Set Assignment** for the customer and change it before creating the customer, because the **Common Set** will not work with the **Customer Site**, and this may cause problems later.

Setup Path: Home Page > Setup and Maintenance > Manufacturing and Supply Chain Materials Management > Organization Structure > Manage business unit set assignment > Save and Close

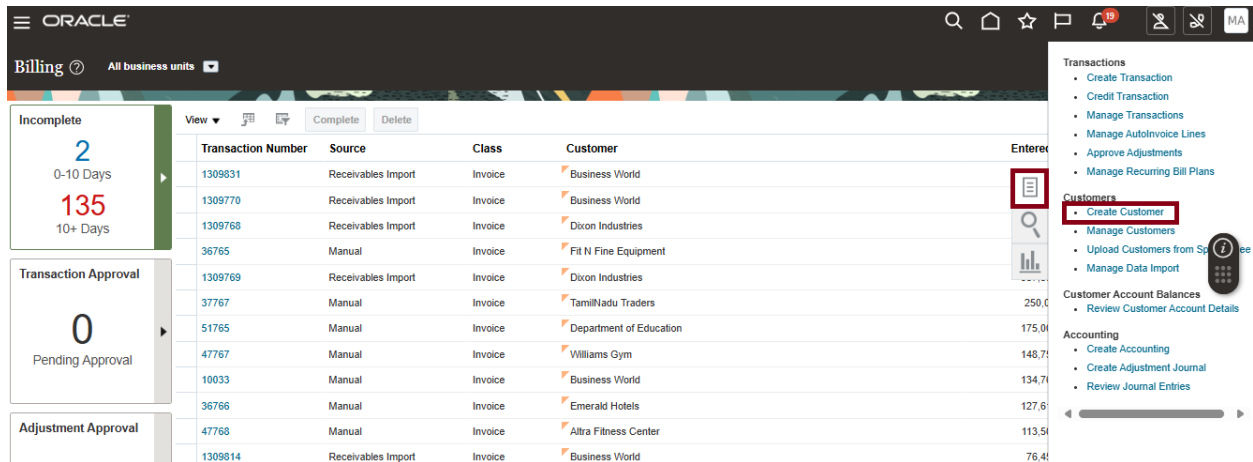

The screenshot shows the Oracle Setup and Maintenance interface. The breadcrumb path is: Setup > Manufacturing and Supply Chain Materials Management > Organization Structure > Manage business unit set assignment. The 'Functional Areas' list on the left includes 'Organization Structures', which is highlighted. The 'Organization Structures' task list on the right includes 'Manage Business Unit Set Assignment', which is also highlighted. Below these, a table lists reference data objects and their sets.

Reference Data Object	Reference Data Set Code	Reference Data Set Name
Apply Hold Reasons	COMMON	Common Set
Cancellation Reasons	COMMON	Common Set
Channel Adjustment Types	COMMON	Common Set
Channel Claim Class Source Map	COMMON	Common Set
Channel Claim Types	COMMON	Common Set
Claim Reasons	COMMON	Common Set
Close Reasons	COMMON	Common Set
Collections Setups	COMMON	Common Set
Contract Types	COMMON	Common Set
Credit Allocation Templates	COMMON	Common Set
Customer Account Relationship	CUSTSITE	Customer Site Set
Customer Account Site	CUSTSITE	Customer Site Set

Here I changed the **Customer Account Relationship** to **CUSTSITE** and the **Customer Account Site** to **CUSTSITE**, and we will see why I did this when creating the customer.

Create Customer:

Setup Path: Home Page > Receivables > Billing > Task List > Create Customer > Fill Data > Save and Close

The screenshot shows the Oracle Create Organization Customer form. The form is divided into several sections: Organization Information, Account Information, and Account Address. The Organization Information section includes fields for Name, Registry ID, D-U-N-S Number, and Taxpayer Identification Number. The Account Information section includes fields for Account Number, Account Description, Account Type, and Customer Class. The Account Address section includes fields for Account Address Set, From Date, and To Date. The form is titled 'Create Organization Customer' and has 'Save and Close' and 'Cancel' buttons at the top right.

Organization Information

* Name: MA Large Customer 2
* Registry ID: 1105525
D-U-N-S Number:
Taxpayer Identification Number:

Account Information

* Account Number: 126140
Account Description: MA Large Customer 2
Account Type: External
Customer Class:
Account Established Date: 20/09/25
Account Termination Date:

Account Address

* Account Address Set: CUSTSITE
* From Date: 20/09/25
To Date:

Here we start entering all the customer's information and data, such as the **Organization Information**, **Account Information**, and **Account Address**. In the **Account Address Set**, I will select the set that we created earlier in the **Assignment Set**.

Address

Site Number 1445239

Site Name

Mail Stop

Country

* Address Line 1

Address Line 2

Address Line 3

* City

State

Postal Code

Account Address Details

Customer Category Code

Site Language

Translated Customer Name

Trading Partner Identifier

EDI Location Code

Here is the customer's address.

Address Purposes

Actions View Format + X Wrap

	Primary	Site	From Date	To Date	Purpose	Bill-to Site
▶	✓	133253	20/09/25	31/12/4712	Bill to	
▶	✓	133252	20/09/25	31/12/4712	Ship to	Cairo, CAI

Then the Address Purposes, which is very important, defines the purpose of the customer's address in the system. That is, what this address will be used for during sales operations.

- **Bill to:** the address where the invoice is sent
- **Ship to:** the address where the goods are delivered

We haven't assigned the BU at the site level, so we will **Save and Close** to start the assignment.

Actions View Format Wrap

Reference Accounts

Business Unit MA BU

Ledger US Primary Ledger

Revenue 101.10.45000.000.000.000

Receivable 101.10.12350.000.000.000

Tax 101.10.13200.000.000.000

Freight 101.10.62520.000.000.000

Unearned Revenue 101.10.24500.000.000.000

Unbilled Receivable 101.10.12310.000.000.000

Autovoice Clearing 101.10.12190.000.000.000

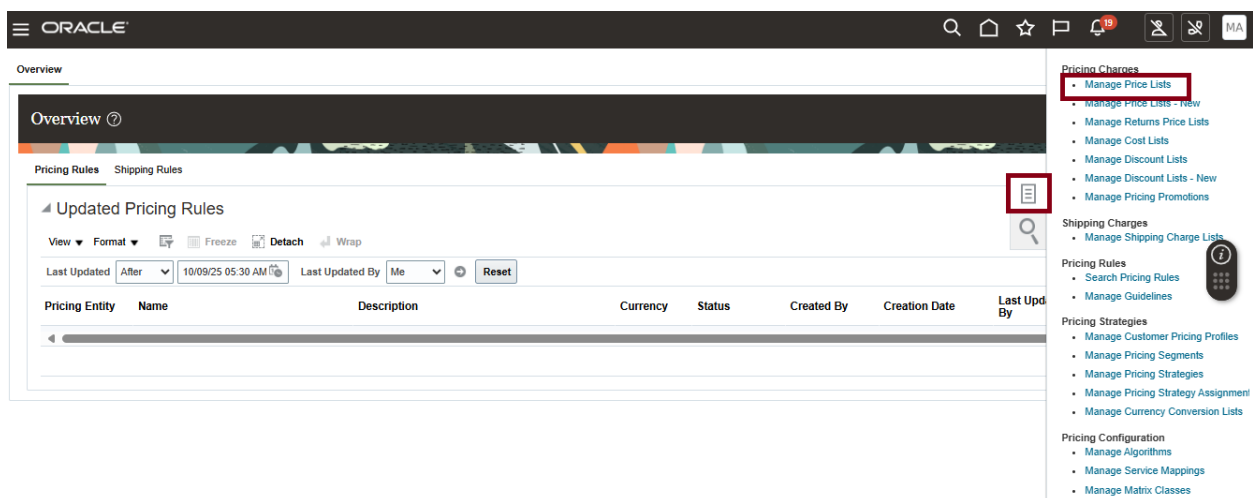

OK Cancel

Then we will **Add** and link it to my BU and add the account numbers we want to include. Here, it's not required. We had already added account numbers in Receivables, so why add them again? Depending on the business need, for example, they might want each customer to have separate accounts so we can track each customer's accounts individually. Then **Save and Close**, and this way we have finished the customer.

2. Manage Price List

The **Price List** is the list that contains the prices of the items the company sells to customers. Simply put, it is the place the system refers to in order to know the product price when creating a Sales Order.

Setup Path: Home Page > Order Management > Pricing Administration > Task List > Manage Price List > Add Data > Save and Close

Oracle Manage Price Lists

Advanced Search

Name: Starts with
Type: Equals

Oracle Manage Price Lists

Create Price List

Name: MA Large Price List
Description: MA Large Price List
Type: Segment price list
Currency: USD - US Dollar
Business Unit: MA BU
Start Date: 20/09/25 05:58 PM
End Date: dd/mm/yy hh:mm a
Pricing Charge Definition: Sale Price
Price Type: One time
Charge Type: Sale
Charge Subtype: Price
Line Type: Buy
Calculation Method: Price

Save and Edit

Here I start entering the data for the **Price List**, and I can create multiple price lists so that each one is made for a specific customer segment. But for now, I will create just one.

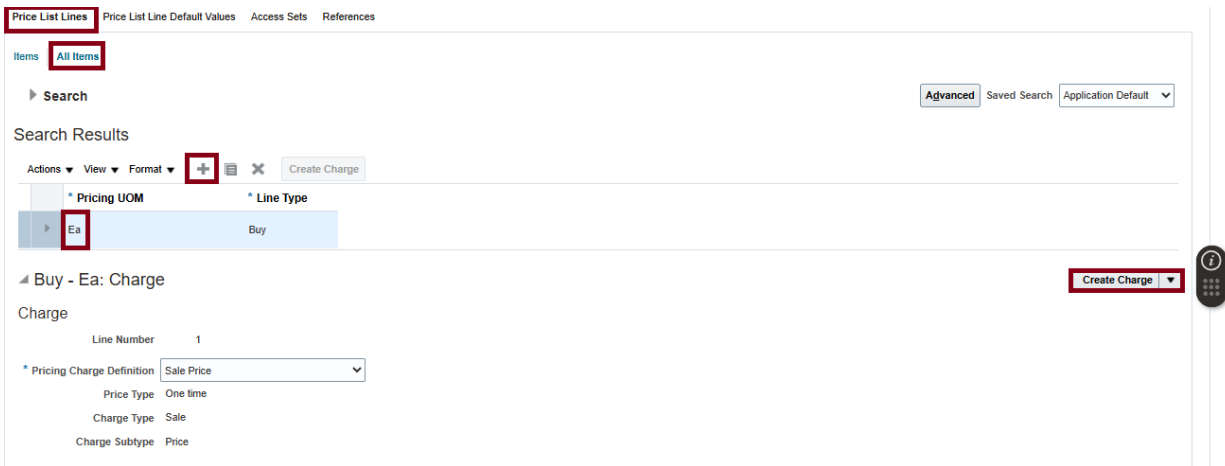

Oracle Edit Price List: MA Large Price List

Name: MA Large Price List
Type: Segment price list
Currency: USD - US Dollar
Start Date: 20/09/25 05:47 PM
End Date: dd/mm/yy hh:mm a

Access Sets

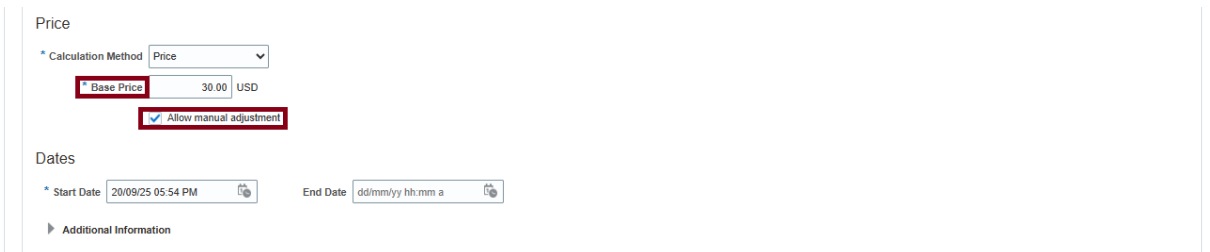

Set Code	Set Name	Set Description
COMMON	Common Set	Common Set Seeded

Here, the **Access Set** will be **Common**, and this not the same set we created earlier for the Customer.

Here in the **Price List Lines**, I have two options: either **All Items**, where I set the price at the UOM level like Ea or Dz, or **Items**, where I set the price at the item itself. Let's assume, for example, I haven't created a Price List for Specific Item; in that case, the system will take the price from the **All Items** price.

Here, I start by **Add** and include the UOM I want, then **Create Charge**.

Here, I enter the **Base Price** and the **Allow Manual Adjustment** checkbox. If I enable it, I can change the base price freely when creating the Sales Order. If I don't enable it, I won't be able to change the base price.

The screenshot shows the 'Create Charge' form with the following details:

- Item Section:** Item MA-001, Description MA-001, Pricing UOM Ea, Line Type Buy, Primary Pricing UOM (checked).
- Charge Section:** Line Number 1, Pricing Charge Definition Sale Price, Price Type One time, Charge Type Sale, Charge Subtype Price.
- Price Section:** Calculation Method Price, Base Price 15.00 USD, Allow manual adjustment (unchecked).
- Dates Section:** Start Date 20/09/25 06:14 PM, End Date (placeholder).

Here in the **Item** section, I **Add** the items I need, and I can also set the UOM. I can choose the same item with multiple UOMs, for example, one price for Ea and another for Dz. Then I **Create Charge** and enter the **Base Price**.

After that, I **Save and Close**, and this way I have created the first segment.

3. Manage Pricing Lookups

Setup Path: Home Page > Setup and Maintenance > Order

Management > Pricing > Manage Pricing Lookups > Fill Data > Save and Close

Pricing Lookups are **Lists of Values** we use in the pricing system to classify customers or products according to certain criteria that help the system or the pricing team determine the right price.

The system already has lookup codes for each Lookup Type, but I will add codes in each one that are specific to me to avoid confusion. These are the Lookup Types we will work on:

1. **Customer Rating** – the customer's rating based on previous dealings: High, Low, Medium
2. **Revenue Potential** – how much sales this customer can generate for the company in the future: High, Low, Medium

3. **Cost to Serve** – how much the company spends to serve this customer
4. **Customer Value** – the strategic value of the customer to the company
5. **Customer Size** – the size of the customer as a company
6. **Pricing Segments** – dividing customers into groups based on certain characteristics to apply different pricing strategies

Oracle Order Management Setup screen. The 'Pricing' functional area is selected in the left sidebar. In the main 'Pricing' task list, 'Manage Pricing Lookups' is highlighted.

Manage Pricing Lookups configuration page. The 'Meaning' field is set to 'Customer Rating'. Below, the 'ORA_QP_CUSTOMER_RATING_VALUES: Lookup Codes' table is shown with the 'MA_VERY_HI' row highlighted.

Lookup Code	Display Sequence	Enabled	Start Date	End Date	Meaning	Description	Tag	Lookup values descriptive flexfield
MA_VERY_HI	3	☒	dd/mm/yy	dd/mm/yy	MA Very High	MA Very High		
MA_MEDIUM	2	☒	dd/mm/yy	dd/mm/yy	MA Medium	MA Medium		
MA_LOW	1	☒	dd/mm/yy	dd/mm/yy	MA Low	MA Low		
ORA_LOW	1	☒	01/01/59		Low			
ORA_MEDIUM	2	☒	01/01/59		Medium			
ORA_HIGH	3	☒	01/01/59		High			
ORA_VERY_HI...	4	☒	01/01/59		Very high			

Here I started entering my own codes so they will appear in the **List of Values**.

Lookup Type	Meaning	Description	Module	Lookup Configuration Level	REST Access Secured
ORA_QP_CUST_PRICIN...	Pricing Segments	List of pricing segments.	Pricing Administration	Extension	Authenticated

ORA_QP_CUST_PRICING_SEGMENTS: Lookup Codes									
Actions View Format + X [Icons] [Icons] [Icons] [Icons] [Icons] [Icons] [Icons] [Icons] [Icons] [Icons]									
Lookup Code	Display Sequence	Enabled	Start Date	End Date	Meaning	Description	Tag	Lookup values descriptive flexfield Lookup_DFF	
CHERRY	1	☒	01/09/25	dd/mm/yy	Cherry Pricing Segment	Cherry Pricing Segment			
MA_LOW_SEG...	1	☒	dd/mm/yy	dd/mm/yy	MA Low Segment	MA Low Segment			
MA_MEDIUM_...	2	☒	dd/mm/yy	dd/mm/yy	MA Medium Segment	MA Medium Segment			
MA_LARGE_S...	3	☒	dd/mm/yy	dd/mm/yy	MA Large Segment	MA Large Segment			

Here in the **Price Segment**, I did the same thing and added my own codes.

I will do the same for the rest of the Lookup Types mentioned above so we can continue our work.

4. Manage Customer Pricing Profile

Setup Path: Home Page > Order Management > Pricing Administration > Task List > Manage Customer Pricing Profile > Add Data > Save and Close

The **Customer Pricing Profile** is a setup we create for the customer to define their pricing characteristics within the system.

Overview

Cost to Serve: MA Very High

Customer Value: MA Very High

Customer Rating: MA Very High

Customer Size: MA Large

* Start Date: 20/09/25 08:10 PM

End Date: dd/mm/yy hh:mm a

Save and Close

Here I **Add** and start selecting the customers I want and link them to the Lookups we just created. This means I am telling the system that this customer has a high segment, and so on.

5. Manage Price Segment

Setup Path: Home Page > Order Management > Pricing Administration > Task List > Manage Pricing Segment > Add Data > Save and Close

Here I start linking the customer ratings to the Price Segment that will be applied, just like we are doing now.

The screenshot displays the Oracle Pricing Rules interface. The top section, 'Updated Pricing Rules', shows a table of price lists. The bottom section, 'Manage Pricing Segments', shows a table of pricing segments with columns for conditions and results.

Updated Pricing Rules Table:

Pricing Entity	Name	Description	Currency	Status	Created By	Creation Date	Last Updated By
Price lists	MA Small Price List	MA Small Price List	USD	Approved	muhamadafifi1322	20/09/25 06:46 PM	muhamadafifi1322
Price lists	MA Large Price List	MA Large Price List	USD	Approved	muhamadafifi1322	20/09/25 05:47 PM	muhamadafifi1322
Price lists	MA Distributor Price List	MA Distributor Price List	USD	Approved	muhamadafifi1322	20/09/25 06:19 PM	muhamadafifi1322

Manage Pricing Segments Table:

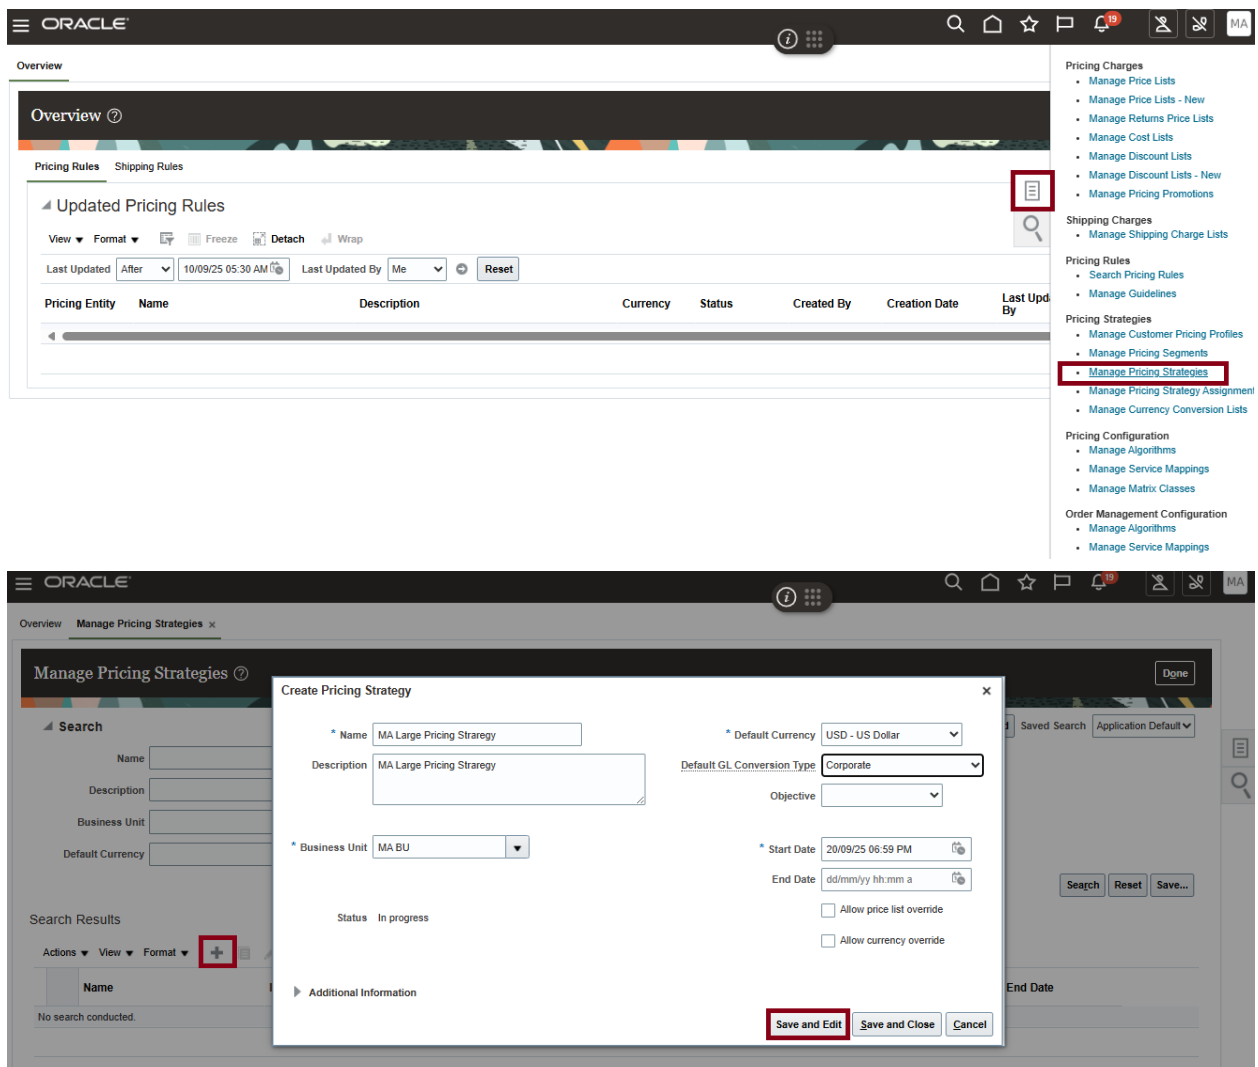

Sta	Revenue Potential (-)	Customer Size (-)	Cost To Serve (-)	Customer Value (-)	Customer Rating (-)	Pricing Segment	Precedence	Start Date
Medium	Medium	Medium	Medium	Medium	Medium	Corporate Segment Group 2	200	02/01/16 03:24 AM
Medium	Medium	Low	Medium	Medium	Medium	Corporate Segment Group D	1,000	02/01/16 03:24 AM
Low	Small	Medium	Low	Low	Low	Corporate Segment Group 3	225	02/01/16 03:34 AM
Very high	Large	Low	Very high	Very high	Very high	Corporate Segment Group 1	100	02/01/16 03:21 AM
Very high		Very high				Supremo Fitness Center Seg	125	01/01/19 03:08 PM
High		High				Supremo Commercial Segme	175	01/01/19 03:08 PM
Medium		High				Supremo Institution Segment	225	01/01/19 03:08 PM
Low	Small	Medium				Supremo Consumer Segmen	275	01/01/19 03:08 PM
Medium		Low				Supremo Retail Segment	325	01/01/19 03:08 PM
Very high	Large	Medium	Very high	Very high	Very high	India Pricing Segment	100	01/06/25 03:53 PM
						Cherry Pricing Segment	90	
MA Very High	MA Large	MA Very High	MA Very High	MA Very High	MA Very High	MA Large Segment	100	20/09/25 08:19 PM
MA Medium	MA Medium	MA Medium	MA Medium	MA Medium	MA Medium	MA Medium Segment	100	20/09/25 08:37 PM
MA Low	MA Small	MA Low	MA Low	MA Low	MA Low	MA Low Segment	100	20/09/25 08:38 PM

Here I have **Condition Columns**. If they are met based on the customer ratings we created, then the **Result Columns** will be applied, meaning the customer will get this Price Segment.

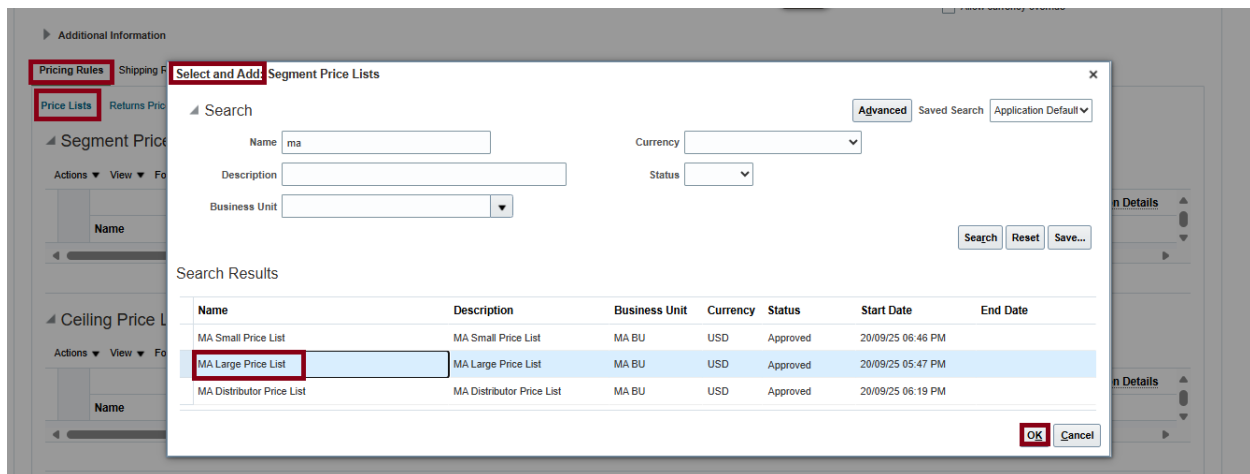

6. Pricing Strategy

Setup Path: Home Page > Order Management > Pricing Administration > Task List > Manage Pricing Strategy > Add Data > Save and Close

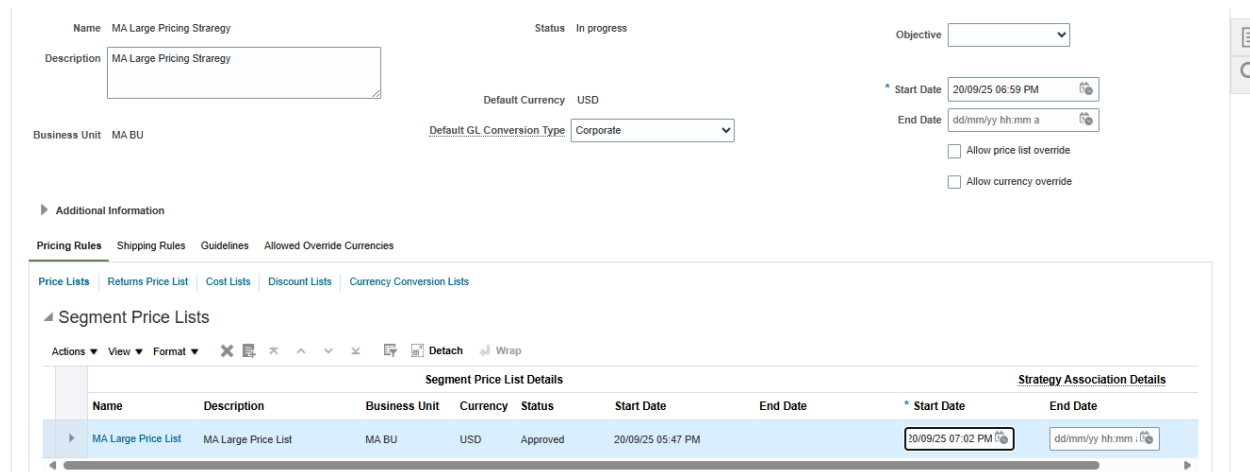

The **Pricing Strategy** is created to link the Price List, Discount List, and Shipping List for a specific segment. We connect them all in one Pricing Strategy so that when the system accesses it, it doesn't take each of them from different places; instead, it gets them all at once.

Here I **Add** the Price Strategy for the segment, link the Price List inside it, connect it to the BU, and then **Save and Edit**.

Here, from the **Price Lists**, I **Select and Add** and choose the Price List I want to link in this Price Strategy.

Here, if there are Discount Lists or Shipping Lists, I can add them here too, but we won't do that now. After that, **Save and Close**.

So far, I haven't linked the Customer Profile, Price Segment, and Price Strategy yet. What will connect all of them together is the **Pricing Strategy Assignment**.

7. Manage Pricing Strategy Assignments

Setup Path: Home Page > Order Management > Pricing Administration > Task List > Manage Pricing Strategy Assignments > Add Data > Save and Close

Here I link the **Price Segment** to the **Price Strategy**.

The screenshot shows the Oracle Pricing Administration interface. The top navigation bar includes the Oracle logo and various icons. The main content area is titled 'Manage Pricing Strategy Assignments'. It features a table with columns: Line, Material Transfer, Internal order, Start Date, and End Date. The table contains three rows: 'Line', 'Header', and 'Sales'. The 'Sales' row is highlighted. Below the table, there is a section titled 'Header-Sales-AII-01/01/2016 22:11: Pricing Strategy Assignment Rules'. This section contains a table with columns: Sta, Channel Method (=), Pricing Segment (=), Transaction Type (=), Pricing Strategy, Precedence, Start Date, and End Date. The table lists several pricing rules, including 'Cherry Pricing Segment', 'MA Low Segment', 'MA Large Segment', and 'MA Medium Segment'. Red boxes highlight the 'Condition Columns' (Pricing Segment) and 'Result Columns' (Pricing Strategy) sections.

Line	Material Transfer	Internal order	Start Date	End Date
Line	Material Transfer	Internal order	28/06/17 11:57 PM	dd/mm/yy hh:mm
Sales	Sales	All	02/01/16 03:41 AM	dd/mm/yy hh:mm
Header	Sales	Service order	01/07/19 12:44 PM	dd/mm/yy hh:mm

Sta	Channel Method (=)	Pricing Segment (=)	Transaction Type (=)	Pricing Strategy	Precedence	Start Date	End Date
		Cherry Pricing Segment		Cherry Pricing Strategy	9		
		MA Low Segment	Sales order	MA Small Pricing strategy	10	20/09/25 08:44 PM	
		MA Large Segment	Sales order	MA Large Pricing Strategy	10	20/09/25 08:45 PM	
		MA Medium Segment	Sales order	MA Distributor Pricing Strategy	10	20/09/25 08:49 PM	

Here we link based on the **Header Sales** where the **Transaction Type** is **All**.

I **Add**, and here it is also divided into **Condition Columns**, which are for the Price Segment. This means when the system finds this Price Segment, it will go to the **Result Columns**, which are for the Pricing Strategy. So here, I have linked the Price Segment to the Pricing Strategy.

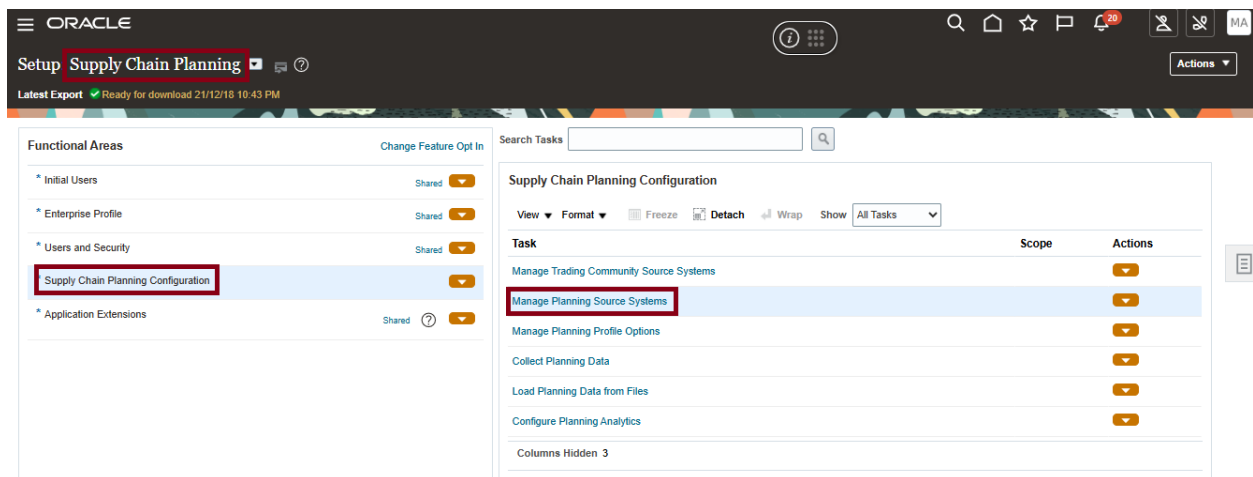

Global Order Promising

The system is responsible for determining available inventory and the items. It knows whether a product is available or not and prevents the sale of unavailable products.

8. Manage Planning Sourcing System

Setup Path: Home Page > Setup and Maintenance > Supply Chain Planning > Supply Chain Planning Configuration > Manage Planning Sourcing System > Add Data > Save and Close

It is the source from which **Planning** and **Global Order Promising** get their data. It is the place where we tell Planning to take their data from here.

Save Save and Close Cancel

Here, I select my **Organizations** and the **Master Organization**, make sure they are **Enabled for Collections**, and then **Save and Close**.

9. Collect Planning Data

Setup Path: Home Page > Setup and Maintenance > Supply Chain Planning > Supply Chain Planning Configuration > Collect Planning Data > Submit

This **Request** starts collecting all the data I have so we can begin creating the Sales Order.

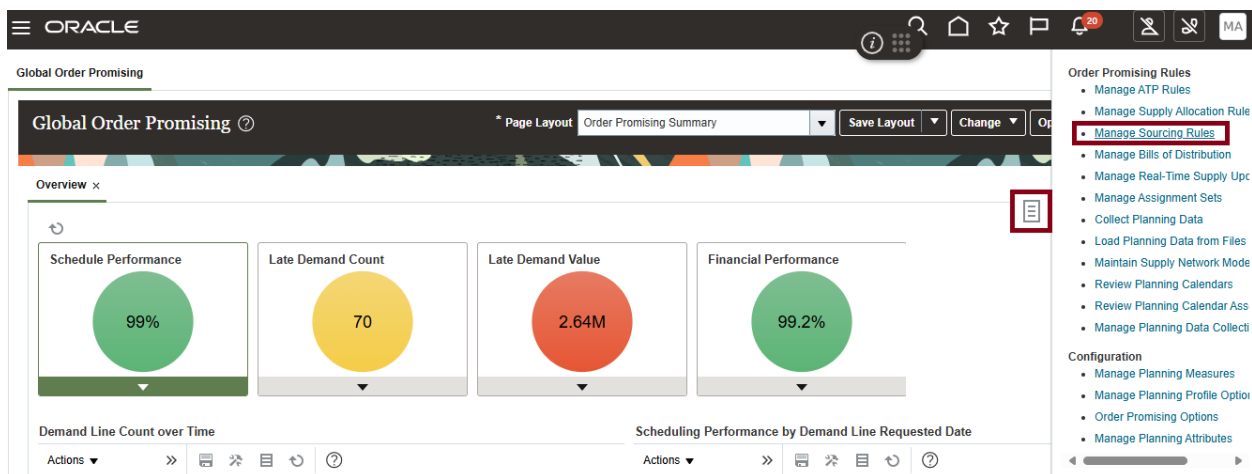

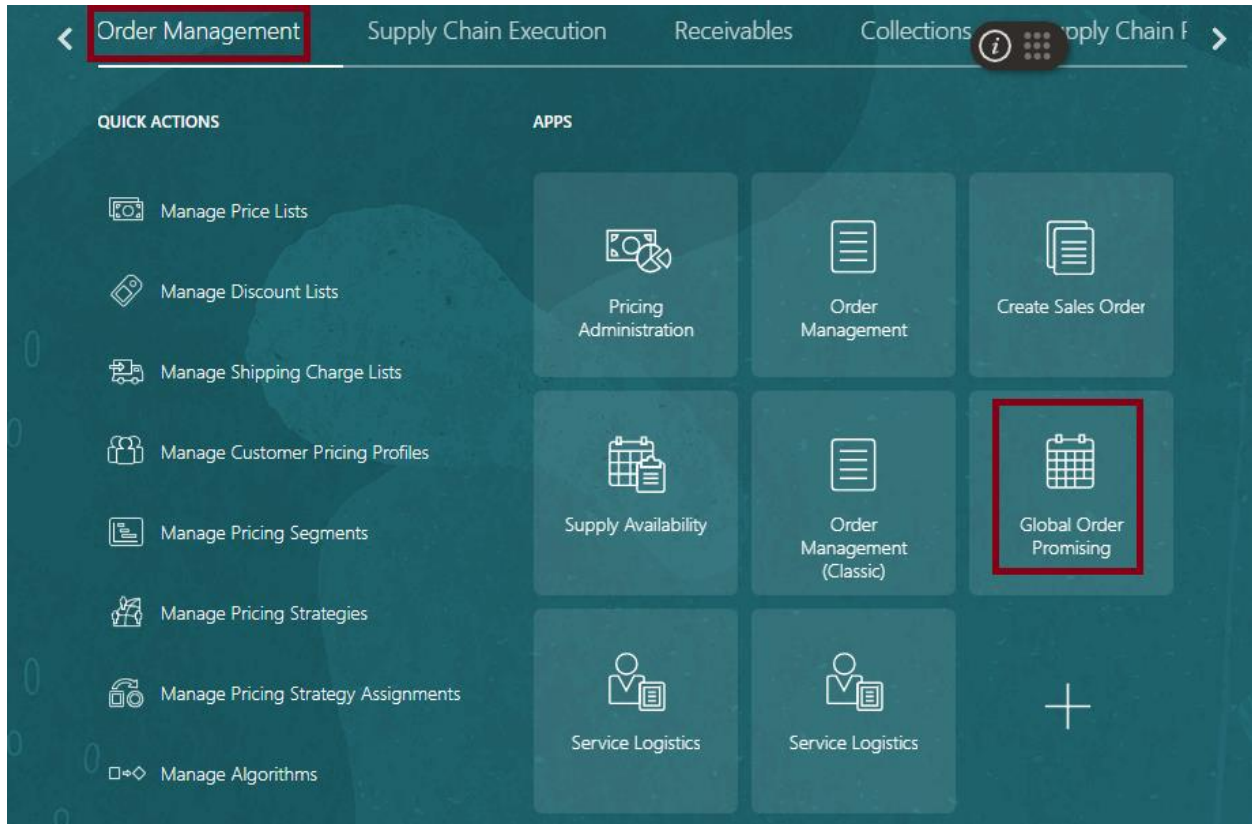

The screenshot displays the Oracle Supply Chain Planning Configuration interface. The top navigation bar includes the Oracle logo, a 'Setup' button, and a 'Supply Chain Planning' dropdown menu. Below the navigation bar, the 'Functional Areas' section on the left lists various configuration areas, with 'Supply Chain Planning Configuration' highlighted. The main panel shows the 'Supply Chain Planning Configuration' task list, where 'Collect Planning Data' is selected. Below this, the 'Source System' is set to 'OPS' and the 'Collection Type' is set to 'Targeted'. The 'Collection Templates' section includes a 'Select Collection Filters' button and a 'Save Template' button. The 'Enable Organization Group Collection' is set to 'No'. The 'Organization Group' is set to 'Oracle Fusion'. The 'Reference Data' section shows a list of 'Reference Entities' on the left and 'Selected Entities' on the right. The 'Selected Entities' list includes 'Customer', 'Items', 'Order Orchestration Reference Objects', and 'Organizations'. At the bottom right, there are 'Submit' and 'Cancel' buttons.

Here, I set the **Collection Type** to **Targeted**, meaning the system will collect only a specific part of the data instead of all the data. Then I start selecting what I need the system to pull data from.

10. Manage Sourcing Rule

Setup Path: Home Page > Order Management > Global Order Promising > Task List > Manage Sourcing Rule > Add Data > Save and Close

It is a rule that determines where the system will get the product from to fulfill the customer's request. It decides whether the product will be shipped from a specific warehouse or purchased from a supplier.

Type	Organization	Supplier	Supplier Site	Supplier Site Source System	* Allocation Percent	* Rank	Shipping	Carrier Name	Mode of Transport	Service Level
Transfer from	MA2				100	2				
Transfer from	MA1				100	1				

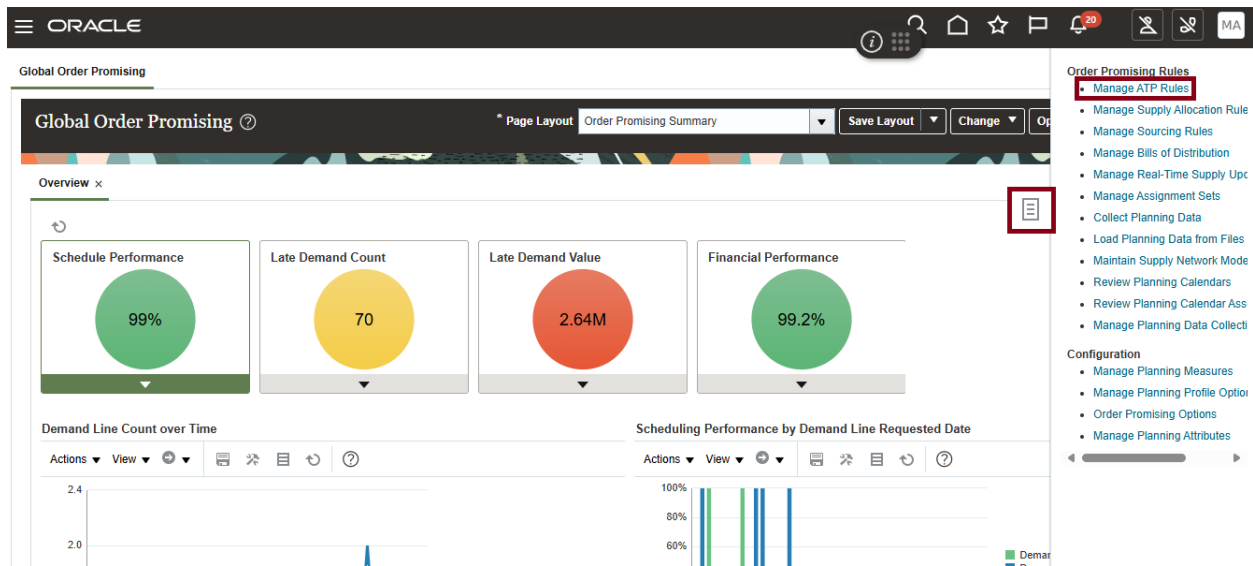

Example format: #,##0

Here I select the **Organization** that the transfer will happen from, or choose a specific **Supplier** if, for example, I buy the goods from them after the Sales Order is created. The **Rank** is used to decide which source the system should check first and get the product from. Then **Save and Close**.

11. Manage ATP Rule

Setup Path: Home Page > Order Management > Global Order Promising > Task List > Manage ATP Rule > Add Data > Save and Close

It is the method the system uses to know whether the product is available and when it can be shipped.

The screenshot shows the 'Create ATP Rule' form in Oracle. The form has a header with 'Create ATP Rule' and buttons for 'Save', 'Save and Close', and 'Cancel'. Below the header, there are input fields for 'Name' (MAATP) and 'Description' (MAATP). A red box highlights the 'ATP Rule Criteria' tab, which is currently selected. Under this tab, the 'Promising Attributes' section is visible, showing 'Promising Mode' set to 'Supply chain availability search'. Other options include 'Search components and resources' (checked), 'Enable profitable to promise search' (unchecked), 'Respect allocation constraints' (unchecked), 'Split order when supply becomes available' (checked), 'Lead Time Considered' (dropdown), 'User-Defined Lead Time in Days' (input field), 'Truncate order fulfillment quantity to nearest integer' (unchecked), and 'Minimum Quantity for Splitting' (input field set to 1).

After we **Add**, we start defining exactly what we want to do:

- **ATP Rule Criteria:** this part defines how the system will calculate availability.
- **Supply chain availability search:** the system searches across the whole supply

chain to find the product, checking inventory, purchase orders, work orders, and transfers between warehouses.

- **Lead time based:** the system doesn't check inventory; it only calculates the date based on lead time.
- **Infinite availability based:** the system assumes the product is always available.
- **Search components and resources:** if the item is a manufactured item, the system checks the components and resources to see if it can produce the product.
- **Split order when supply becomes available:** if the full quantity is not available, the system allows splitting the order. For example, if the customer orders 10 and only 6 are available now, the system ships the 6 and the rest later.

Supply Chain Availability Search Attributes ?

Supply Types ☒ On hand ☒ Purchase orders ☒ Supplier requisitions ☒ Internal requisitions ☒ In-transit supplies ☒ Standard work orders ☒ Nonstandard work orders ☒ Planned supply	Demand Types ☒ Fulfillment lines ☒ Dependent work order demands ☐ Planned order demands	Infinite Availability Time Fence Definition Infinite Availability Fence Definition: Total lead time User-Defined Fence in Days: Past-Due Demand Considered in Days: Past-Due Supply Considered in Days: ATP Time Fence Definition ATP Time Fence Specification: Total lead time User-Defined Fence in Days:
---	--	--

- **Supply Chain Availability Search Attributes:** this part defines what the system will check from the supply and demand.
- **Supply Types:** these are the supply sources that the system will depend on.
- **Demand Types:** these are the demands that consume the inventory.

* Name: MA ATP

Item						MA-001	MA-001	Sourcing rule	MA Global	

Here you start linking them together using the **Item**, and you can also link them by **Organization** if you want.

13. Refresh and Start the Order Promising Server

- This is the last step we will do, and after that we will start creating the **Sales Order**.
- We will run a **Scheduled New Process** called **Refresh and Start the Order Promising Server**.

Process Details

Name: Refresh and Start the Order Promising Server
 Description: Refresh the data used by the Oracle Fusion Glob...
