**How to Read This Document — Platform Indicators**

- ★ ORACLE FUSION CLOUD — Content marked with this badge is specific to Oracle Fusion Cloud (SaaS). This is the PRIMARY focus of this manual.
- ▷ ORACLE EBS (Reference) — Content marked with this badge refers to Oracle E-Business Suite for comparison purposes only.
- ◆ BOTH PLATFORMS — Content applies equally to both Oracle Fusion Cloud and Oracle EBS implementations.

Every chapter clearly labels its content. EBS comparisons are provided to highlight architectural evolution.

**01**

# Enterprise Resource Planning — Foundations & Philosophy

*Understanding ERP as Architecture, Not Just Software*

## 1.1 What Is ERP? The Strategic Perspective

### ◆ BOTH PLATFORMS

**Single Source of Truth.** Every transaction, every journal entry, every inventory movement is captured, validated, and surfaced from one unified data model.

The architectural promise: enforce consistent business rules, generate real-time analytics, and provide a compliant audit trail across an entire enterprise, regardless of geography or legal structure.

**NOTE** Implementations that treat ERP as a software replacement consistently underperform. Transformative implementations treat ERP as the engine of business process re-engineering.

### 1.1.1 Oracle Product Evolution — From EBS to Fusion Cloud

#### ◆ BOTH PLATFORMS

Oracle Fusion Cloud ERP represents Oracle's fourth-generation ERP platform — built from the ground up for the cloud, integrating the best capabilities from PeopleSoft, Siebel, JD Edwards, and Hyperion.

Figure: Oracle ERP Product Evolution Timeline — EBS to Fusion Cloud

| Era       | Product                          | Architecture                          | Deployment          | Upgrade Model          | Status                              |
|-----------|----------------------------------|---------------------------------------|---------------------|------------------------|-------------------------------------|
| 1988–2000 | Oracle EBS R11 [ EBS ]           | Oracle Forms / PL-SQL / Client-Server | On-Premise          | Manual — Disruptive    | Legacy                              |
| 2001–2010 | Oracle EBS R12 [ EBS ]           | OAF / J2EE / SOA Suite                | On-Premise          | Customer-Controlled    | Mainstream — Extended Support 2030+ |
| 2011–2016 | Oracle Fusion On-Prem [ BOTH ]   | ADF / SOA / BPEL                      | On-Premise          | Manual                 | Transitional                        |
| 2016–Now  | Oracle Fusion Cloud [ FUSION ★ ] | REST / OIC / VBCS / AI-ML             | SaaS / Cloud-Native | Quarterly Auto-Upgrade | Strategic Direction — Gold Standard |

### 1.1.2 Cloud Service Models

#### ► ORACLE FUSION CLOUD

Understanding the cloud service model that Oracle Fusion Cloud occupies is fundamental before any implementation decision is made. The table below maps each model to its operational responsibility:

| Feature / Aspect               | ★ Oracle Fusion Cloud                                    | © Oracle EBS (Reference)                                             |
|--------------------------------|----------------------------------------------------------|----------------------------------------------------------------------|
| <b>Deployment Model</b>        | Cloud-native SaaS. Oracle manages all infrastructure.    | Primarily on-premise. Customer manages all layers.                   |
| <b>Upgrades</b>                | Quarterly automatic upgrades — always on latest version. | Major disruptive upgrades (R11→R12). Customer-controlled and costly. |
| <b>Infrastructure</b>          | Zero infrastructure management by customer.              | Customer owns servers, OS, DB, patching.                             |
| <b>Customization Approach</b>  | Configuration + Oracle-approved Extensions (VBCS, OIC).  | Extensive code-level customization (Forms, PL/SQL, OAF).             |
| <b>Total Cost of Ownership</b> | Lower long-term TCO — no infrastructure, auto-upgrades.  | Higher TCO — infrastructure, upgrade projects, patch cycles.         |

**BEST PRACTICE** In a Fusion Cloud SaaS engagement, the implementation team's focus shifts entirely from infrastructure management to business process optimization and configuration — the single greatest advantage over EBS.

| Service Model     | Analogy                         | Customer Manages                    | Oracle Manages                 | Oracle Example                      |
|-------------------|---------------------------------|-------------------------------------|--------------------------------|-------------------------------------|
| <b>On-Premise</b> | Build your own kitchen          | Everything: hardware to application | Nothing                        | Oracle EBS (Customer-hosted)        |
| <b>IaaS</b>       | Rent the kitchen space          | OS, Middleware, App, Data           | Servers, Storage, Network      | Oracle Cloud Infrastructure (OCI)   |
| <b>PaaS</b>       | Use a shared commercial kitchen | Application & Data                  | OS, Middleware, Runtime, Infra | Oracle Integration Cloud (OIC)      |
| <b>SaaS</b>       | Order a fully prepared meal     | Configuration & Data only           | All technical layers           | Oracle Fusion Cloud ERP / SCM / HCM |

## Enterprise Structure — Multi-Org Architecture Deep Dive

*From Business Group to Sub-Inventory: The Complete Organizational Hierarchy*

### 2.1 Multi-Org Design Philosophy

#### ► ORACLE FUSION CLOUD

The Enterprise Structure in Oracle Fusion Cloud is the foundational configuration layer upon which every subsequent functional setup depends. It defines the legal, financial, and operational boundaries of your

organization within the system. Errors made at this stage cascade catastrophically downstream — affecting data security, financial reporting, tax compliance, and operational workflows simultaneously.

**The cardinal rule of Enterprise Structure design:** never begin configuration until the organizational hierarchy has been fully documented, validated with senior stakeholders, and signed off by both Finance and IT leadership. A single Business Unit omitted, or a Legal Entity misclassified can require a complete data teardown and rebuild — a scenario that has derailed major enterprise implementations worldwide.

Figure: Oracle Fusion Cloud Multi-Org Hierarchy — 7 Levels vs EBS Structure

## 2.2 The Seven-Level Organizational Hierarchy

### ► ORACLE FUSION CLOUD

Oracle Fusion Cloud organizes enterprise structure across seven logical levels. Each level governs specific functional capabilities, security boundaries, and reporting dimensions:

| Level | Component                          | Functional Role                                                                       | Key Attribute                                                                | EBS Equivalent               |
|-------|------------------------------------|---------------------------------------------------------------------------------------|------------------------------------------------------------------------------|------------------------------|
| 1     | Enterprise [ FUSION ]              | Apex container — one per Fusion instance. Defines the global organizational boundary. | Single per deployment. No financial transactions recorded here.              | Business Group (HCM context) |
| 2     | Legal Entity (LE) [ FUSION / EBS ] | Legally incorporated body. Owns assets, files taxes, generates statutory reports.     | Must have at least one Primary Ledger. Required for VAT / Tax configuration. | Legal Entity                 |

|   |                                          |                                                                                            |                                                                                        |                         |
|---|------------------------------------------|--------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|-------------------------|
| 3 | Primary Ledger [ FUSION ]                | The Book of Record. Defines the 4 C's: Chart of Accounts, Calendar, Currency, Convention.  | All financial transactions post here. Defines Accounting Method (IFRS / GAAP).         | Set of Books            |
| 4 | Business Unit (BU) [ FUSION ★ ]          | Operational processing center for P2P, O2C workflows. Enables Shared Service Center model. | NOT directly tied to Ledger — the key architectural evolution from EBS Operating Unit. | Operating Unit (OU)     |
| 5 | Reference Data Set [ FUSION ★ ]          | Data sharing container enabling multiple BUs to share reference data.                      | Controls data isolation vs. sharing at granular level.                                 | Not available in EBS    |
| 6 | Inventory Organization [ FUSION / EBS ]  | Primary SCM unit — manages physical inventory, manufacturing, warehousing.                 | Linked to Legal Entity. All costing, picking, and receiving occur here.                | Inventory Organization  |
| 7 | Sub-Inventory / Locator [ FUSION / EBS ] | Granular storage location — the physical bin address of a stock item.                      | Locators enable precise bin-level tracking. Supports WMS integrations.                 | Sub-Inventory / Locator |

## 2.2.1 The Critical Structural Evolution: Fusion BU vs EBS Operating Unit

The most architecturally significant difference between Oracle EBS and Oracle Fusion Cloud is the decoupling of the Business Unit from the Ledger. This seemingly subtle change unlocks the Shared Service Center model at enterprise scale:

| Feature / Aspect             | ★ Oracle Fusion Cloud                                                              | © Oracle EBS (Reference)                                                             |
|------------------------------|------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| <b>Entity to Ledger Link</b> | BU is DECOUPLED from Ledger. One BU can serve multiple Legal Entities (SSC model). | OU is DIRECTLY tied to Set of Books. One OU = One ledger = Hard coupling.            |
| <b>Shared Service Center</b> | Native SSC model — 1 Procurement BU serves 8+ Legal Entities simultaneously.       | Not natively possible. Requires extensive custom development and MOAC configuration. |
| <b>Configuration Scale</b>   | 12 subsidiaries → 3 Business Units. 75% configuration reduction.                   | 12 subsidiaries → 12 Operating Units → 12 Sets of Books. Full duplication.           |
| <b>Period Close Impact</b>   | Single BU close covers multiple LEs. Faster, consolidated period-end.              | Each OU closes independently. 12 OU = 12 separate close processes.                   |
| <b>Cross-Entity SCM</b>      | Multiple BUs from different LEs can receive goods at same Inventory Org.           | Impossible without custom code across OU boundaries.                                 |

## 2.3 Inventory Organization — SCM Operational Core

### ► ORACLE FUSION CLOUD

The Inventory Organization is the operational heartbeat of Oracle SCM. Every physical supply chain activity — goods receipt, quality inspection, sub-inventory transfer, pick-and-pack, shipment confirmation — occurs within the context of a specific Inventory Organization. Its configuration determines cost accounting behavior, costing method, and transaction routing.

- **Item Master Organization:** Virtual (non-transacting) parent. Owns authoritative item definitions. All child Orgs inherit from it. NEVER configure as a physical warehouse.
- **Manufacturing Organization:** Configured for discrete or process manufacturing. Linked to Work Definition and Cost Management.
- **Warehouse Organization:** Transacting Org for inbound receiving, storage, and outbound fulfillment. Typically OIC-integrated with WMS.
- **Staging Organization:** Virtual intermediate Org for in-transit accounting between sites.

**CAUTION** Configuring Item Master Organization as a physical transacting warehouse is the #1 Inventory setup error in Oracle implementations. It causes irreconcilable reporting inconsistencies and cost distortions.

### 2.3.1 Inter-Organization Transfer Configurations

The mechanism for moving inventory between Inventory Organizations is architecturally significant because each transfer type generates different accounting entries and operational workflows:

| Transfer Type              | Mechanism                                                                                                | Transit Account Required?                        | Use Case                                                           |
|----------------------------|----------------------------------------------------------------------------------------------------------|--------------------------------------------------|--------------------------------------------------------------------|
| <b>Direct Transfer</b>     | Immediate inventory ownership transfer. One transaction posts simultaneously to both Orgs.               | No                                               | Same-facility transfers between storage areas.                     |
| <b>In-Transit Transfer</b> | Inventory leaves the sending Org and is held in a Transit Account until received by the destination Org. | Yes — Inter-Org Transit Account                  | Cross-site or cross-country transfers. Supports shipment tracking. |
| <b>Consigned Transfer</b>  | Inventory physically moves but ownership remains with the supplier until consumed.                       | Supplier-owned — Balance Sheet reporting differs | Vendor-Managed Inventory (VMI) programs.                           |

**CAUTION** Failure to configure the Inter-Org Transit Account in the Subledger Accounting rules will cause transfer transactions to post to the Suspense Account — a reconciliation nightmare that becomes exponentially more complex the longer it goes undetected in production

### 2.3.2 Costing Methods — Fusion vs EBS

Costing Method is defined at the Inventory Organization level — not at the item level. This organization-wide setting determines how inventory value is calculated, how cost variances are recorded, and what level of granularity is available in financial reporting:

| Feature / Aspect          | ★ Oracle Fusion Cloud                                                                                        | © Oracle EBS (Reference)                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>Standard Cost</b>      | Supported — industry-preferred for manufacturing. PPV, usage variance auto-posted to dedicated CoA accounts. | Supported — same concept but costing update process is more manual and form-driven. |
| <b>Average Cost (WAC)</b> | Supported — recommended for distribution and trading. No variance accounts needed.                           | Supported — same mechanism, but re-averaging triggers require manual process runs.  |
| <b>FIFO</b>               | Supported — for perishable goods, pharma, F&B.                                                               | Supported — but lot-level tracking configuration is more complex in EBS.            |
| <b>LIFO</b>               | Not permitted under IFRS. US GAAP only.                                                                      | Supported for US GAAP environments. Not available under IFRS.                       |
| <b>Project Costing</b>    | Native project-level cost tracking via OPM integration.                                                      | Requires separate Oracle Projects module configuration.                             |

# The Global Accounting Engine — The Power of the 4 C's

*Chart of Accounts · Calendar · Currency · Convention: The Financial Architecture Foundation*

## 3.1 Why Every SCM Consultant Must Master the 4 C's

► ORACLE FUSION CLOUD

The single most common knowledge gap in Oracle SCM consultants is the assumption that accounting configuration is exclusively the domain of the Finance team. This assumption is architecturally incorrect and operationally dangerous. In Oracle Fusion Cloud, every supply chain transaction — every goods receipt, every inter-organization transfer, every shipment confirmation — generates an automated accounting entry. If the financial foundation is incorrectly configured, the impact surfaces in SCM operations, not just in the General Ledger.

The Primary Ledger is defined by four mandatory attributes — the 4 C's — and these four attributes collectively constitute the Global Accounting Engine. Understanding them is non-negotiable for any implementation professional.

### The 4 C's — Global Accounting Engine (Oracle Fusion Cloud)

ORACLE FUSION CLOUD

Figure: The 4 C's — Global Accounting Engine Architecture (Oracle Fusion Cloud)

## 3.2 C1 — Chart of Accounts: The Financial DNA

### ► ORACLE FUSION CLOUD

The **Chart of Accounts (CoA)** is the structured taxonomy of financial accounts used to classify every monetary event in the enterprise. In Oracle Fusion, the CoA is not a flat list of account numbers — it is a multi-dimensional **Key Flexfield (KFF)** structure composed of Segments. Each segment captures a specific financial dimension of a transaction.

### 3.2.1 CoA Segment Architecture

A well-designed CoA typically includes the following segments, though the exact configuration is enterprise-specific:

| Segment                  | Purpose                                                                      | Example Values                                  | Fusion Config                                | EBS Equivalent       |
|--------------------------|------------------------------------------------------------------------------|-------------------------------------------------|----------------------------------------------|----------------------|
| <b>Company / Entity</b>  | Identifies the Legal Entity responsible for the transaction.                 | 1000=Parent   2000=UAE   3000=KSA               | KFF Segment — Value Set driven               | Company Segment      |
| <b>Cost Center</b>       | Organizational unit incurring cost or generating revenue.                    | 100=Finance   200=Procurement   300=Ops         | Hierarchical Value Sets for roll-up          | Cost Center Segment  |
| <b>Natural Account</b>   | The fundamental financial classification (Asset/Liability/Revenue/Expense).  | 1xxx=Assets   5xxx=Expenses                     | Account Type property drives P&L vs. B/S     | Account Segment      |
| <b>Product / Service</b> | Revenue and cost tracking at product category level.                         | SCM001=Supply Chain   MFG002=Manufacturing Line | Optional segment — add without schema change | Product Segment      |
| <b>Intercompany</b>      | Identifies intercompany transactions for elimination in group consolidation. | IC-UAE-001   NONE for external Txns             | Auto-elimination in Fusion Consolidation Hub | Intercompany Segment |

| Feature / Aspect        | ★ Oracle Fusion Cloud                                                     | © Oracle EBS (Reference)                                           |
|-------------------------|---------------------------------------------------------------------------|--------------------------------------------------------------------|
| <b>CoA Flexibility</b>  | Fully flexible KFF — add/modify segments without schema changes.          | Fixed KFF structure — structural changes require DBA involvement.  |
| <b>Cross-Validation</b> | Cross-Validation Rules (CVRs) enforced at entry time. Prevents miscoding. | CVRs available but less robust. Often bypassed via manual journal. |

|                            |                                                                                    |                                                                        |
|----------------------------|------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| <b>Account Hierarchies</b> | Multiple hierarchies per CoA — IFRS, Management, Budget dimensions simultaneously. | Single hierarchy per chart. Multiple reporting requires separate SOBs. |
| <b>Reporting Trees</b>     | Tree-based reporting hierarchies independent of account structure.                 | Requires FSG (Financial Statement Generator) report configuration.     |

### 3.2.2 Cross-Validation Rules (CVR)

**Cross-Validation Rules (CVRs)** enforce business-driven constraints on which segment value combinations are valid. They are one of the most powerful — and most underutilized — controls in Oracle Fusion Finance.

Example: A CVR can enforce the rule that Cost Center 400 (IT Department) may only post to Account range 5500–5599 (IT Operating Expenses). Any transaction attempting to post IT costs to the Manufacturing Expense account (5200–5299) will be rejected at the point of entry — preventing miscoding at the source rather than requiring manual journal corrections at period-close.

- CVRs are defined at the Value Set level, not the Ledger level, making them reusable across multiple ledgers sharing the same CoA structure.
- CVRs can be configured as either Include or Exclude rules, with effective date ranges for time-limited business scenarios.
- In high-volume transactional environments, excessive CVRs can create processing overhead — design with precision, not comprehensiveness.

### 3.2.3 Account Hierarchies and Reporting Trees

Account Hierarchies in Oracle Fusion enable flexible roll-up reporting without modifying the CoA structure. A single set of account codes can be organized into multiple hierarchies — one for IFRS reporting, one for management reporting, one for cost center budgeting — each reflecting a different analytical lens on the same underlying data.

## 3.3 C2 — Accounting Calendar

### ► ORACLE FUSION CLOUD

**The Accounting Calendar** defines the fiscal year structure — the number and duration of accounting periods within a financial year. Oracle Fusion supports multiple calendar types simultaneously, accommodating complex multi-national reporting requirements.

| Calendar Type              | Structure                                                  | Use Case                                        | Fusion vs EBS                                                                 |
|----------------------------|------------------------------------------------------------|-------------------------------------------------|-------------------------------------------------------------------------------|
| <b>Standard Calendar</b>   | 12 monthly periods + adjustment periods.                   | Most commercial enterprises globally.           | Fusion: Period Close Orchestration dashboard.<br>EBS: Manual subledger close. |
| <b>4-4-5 Calendar</b>      | 52-week year in 13 four-week periods.                      | Retail, FMCG, CPG companies.                    | Both platforms support — Fusion alerts on misaligned periods.                 |
| <b>52/53 Week Calendar</b> | Year-end floats to nearest Saturday/Monday.                | US Retail (Walmart model).                      | Fusion handles automatically.<br>EBS requires manual year-end adjustment.     |
| <b>Adjustment Periods</b>  | P13 / P14 — audit entries only, no inventory transactions. | All enterprises requiring year-end adjustments. | Both support. Fusion enforces no SCM transactions in adjustment periods.      |

**NOTE** *The Accounting Calendar, once assigned to a Primary Ledger in Fusion, cannot be changed post-production. This is identical in EBS. Calendar design must be governance-approved before any Ledger configuration begins.*

### 3.3.1 Period Close Orchestration

Period-end close in Oracle Fusion is a structured, orchestrated sequence of activities across Subledgers and the General Ledger. The SCM consultant must understand this sequence because Inventory Period Close is a prerequisite for GL period close:

1. **Inventory Period Close:** All pending inventory transactions must be processed. Unprocessed transactions will block the close.
2. **Cost Accounting Period Close:** All cost accounting entries (material cost, overhead absorption, variance posting) must be transferred to GL.
3. **Subledger Close:** Payables, Receivables, Fixed Assets subledger periods must be closed before GL.
4. **General Ledger Period Close:** Once all subledgers confirm closure, the GL period can be closed — preventing further posting.
5. **Reporting:** Period-end trial balance, inventory valuation report, and management pack generation.

## 3.4 C3 — Currency: Multi-Currency Architecture

### ► ORACLE FUSION CLOUD

Oracle Fusion Cloud provides an enterprise-grade, multi-currency architecture that supports simultaneous reporting in multiple currencies at the ledger level — a capability that EBS required separate Reporting Set of Books to achieve.

| Feature / Aspect                  | ★ Oracle Fusion Cloud                                                         | ◎ Oracle EBS (Reference)                                                   |
|-----------------------------------|-------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| <b>Multi-Currency on 1 Ledger</b> | Primary + Reporting Currency on a single Ledger. No separate ledger needed.   | Required separate Reporting Set of Books — full configuration duplication. |
| <b>Exchange Rate Loading</b>      | REST API integration with FX data providers for automated daily rate loading. | Manual GL Daily Rates entry or custom concurrent programs.                 |
| <b>Currency Conversion</b>        | Automated at transaction time. Audit trail maintained in both currencies.     | Automated but required additional configuration for each currency pair.    |
| <b>Dual Reporting</b>             | Reporting Currency defined once on Primary Ledger.                            | Required a completely separate Reporting SOB with independent setup.       |

### 3.4.1 Exchange Rate Types and Automation

Oracle Fusion distinguishes between multiple exchange rate types, each serving a specific accounting and operational purpose:

- **Corporate Rate:** Centrally defined by the treasury function. Applied to inter-company transactions and group management reporting. Typically set monthly.
- **Spot Rate:** Market rate on the transaction date. Applied to individual supplier or customer transactions. Can be auto-loaded from Oracle's GL Daily Rates table via ERP integration with FX data providers.
- **User Rate:** Manually entered by the user at transaction time. Requires specific role privileges. Used for exceptional transactions where standard rates do not apply.
- **Fixed Rate:** Applicable to currencies pegged to another currency — e.g., AED to USD at 3.6725. Loaded once and remains static until monetary policy changes.

**BEST PRACTICE** For enterprises with high-volume multi-currency transactions, configure Oracle's automated Exchange Rate Loader to pull daily rates from a financial data provider via REST API into the GL Daily Rates table. This eliminates manual rate entry errors — one of the leading causes of financial restatements in multi-currency implementations.

## 3.5 C4 — Convention: The Accounting Method

### ► ORACLE FUSION CLOUD

**The Accounting Convention** — also referred to as the Accounting Method — defines the regulatory framework under which all financial transactions are recognized, measured, and reported. It answers the fundamental question: *"Under what set of accounting rules does this Legal Entity operate?"*

| Convention        | Standard                                       | Key Principles                                                                               | Jurisdiction                                                           |
|-------------------|------------------------------------------------|----------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| <b>IFRS</b>       | International Financial Reporting Standards    | Principles-based. IFRS 15 (revenue), IFRS 16 (leases), IFRS 9 (instruments). Prohibits LIFO. | UAE, EU, KSA (partially), India, Australia, most of Africa and Asia.   |
| <b>US GAAP</b>    | Generally Accepted Accounting Principles (USA) | Rules-based. Allows LIFO. Revenue under ASC 606.                                             | USA-listed companies and US subsidiaries.                              |
| <b>Local GAAP</b> | Country-specific national standards            | Varies by jurisdiction. May conflict with IFRS.                                              | Saudi SOCPA, Egyptian EAS, Kuwaiti KAAA, etc.                          |
| <b>Dual GAAP</b>  | IFRS primary + Local GAAP secondary            | Requires Secondary Ledger in Accounting Setup Manager.                                       | Multi-nationals with simultaneous IFRS group + local statutory filing. |

## 3.6 Subledger Accounting (SLA) — The Accounting Translation Layer

### ► ORACLE FUSION CLOUD

**Subledger Accounting (SLA)** is Oracle Fusion's configurable accounting engine — the layer that translates operational events from SCM and Finance into precise General Ledger journal entries. SLA sits between the operational modules (Inventory, Procurement, Receivables) and the GL, acting as a rule-governed transformation engine.

### 3.6.1 The SLA Architecture Stack

| SLA Component                 | Role                                                                                                                                                           | Configuration Complexity                      |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| <b>Accounting Event Class</b> | Categorizes operational events by type — e.g., "Deliver," "Return to Vendor," "Inter-Org Transfer." Each event class triggers a specific accounting treatment. | Read-Only — Oracle-seeded. Cannot be created. |

|                                       |                                                                                                                                                                                                 |                                                                     |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|
| <b>Accounting Event Type</b>          | Refines the event class to a specific business action — e.g., "Deliver to Expense," "Deliver to Inventory," "Deliver to Project."                                                               | Read-Only — Oracle-seeded.                                          |
| <b>Journal Line Types (JLT)</b>       | Defines the debit/credit structure of the accounting entry for a specific event type. Specifies which side of the entry (Dr/Cr) and what account derivation rule applies.                       | Configurable — Enterprise-specific JLTs can be created.             |
| <b>Account Derivation Rules</b>       | The intelligence layer — determines which GL account receives the posting. Can derive accounts from: Item Category, Inventory Organization, Transaction Type, Cost Element, or any combination. | High complexity — requires both functional and technical expertise. |
| <b>Journal Entry Rule Sets (JERS)</b> | The complete accounting prescription for a given Accounting Event — assembling JLTs and Account Derivation Rules into a deployable accounting template.                                         | Configured per Legal Entity / Ledger.                               |
| <b>Accounting Methods</b>             | The top-level container assigning Journal Entry Rule Sets to specific Accounting Event Classes — the master configuration object.                                                               | Assigned to the Primary Ledger in Accounting Setup Manager.         |

**Field Scenario:** A global manufacturing company migrating from EBS to Fusion Cloud discovered that their EBS inventory accounting used a single Inventory Account for all item categories. Post-migration, the SLA was configured with Account Derivation Rules that automatically route accounting to separate Inventory Accounts by Item Category (Raw Material, WIP, Finished Goods) and Inventory Organization — with zero custom code. The resulting financial visibility eliminated a quarterly manual reclassification exercise that had consumed three accountants for five working days each quarter.

Figure: Subledger Accounting (SLA) Architecture — Oracle Fusion Cloud

| Feature / Aspect           | ★ Oracle Fusion Cloud                                                                      | © Oracle EBS (Reference)                                                                     |
|----------------------------|--------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| <b>SLA Configurability</b> | Fully configurable — Account Derivation Rules, JLT, JERS per event type. Zero custom code. | Limited SLA engine. Many accounting rules hardcoded. Manual journal reclassification common. |
| <b>Account Derivation</b>  | Dynamic derivation from Item Category, Inventory Org, Transaction Type simultaneously.     | Fixed account derivation — limited to static account assignments.                            |
| <b>Audit Trail</b>         | Complete event-level accounting trail from SCM event to GL journal.                        | Basic audit trail. Detailed SCM-to-GL tracing requires custom queries.                       |
| <b>GRIR Management</b>     | Automated GRIR clearing with real-time reconciliation reports.                             | Manual GRIR reconciliation via custom SQL or period-end reports.                             |

CH.

04

## Functional Setup Manager & Security Architecture

*FSM: The Implementation Command Center | RBAC: The Oracle Fusion Security Model*

### 4.1 Functional Setup Manager (FSM)

#### ► ORACLE FUSION CLOUD

**The Functional Setup Manager (FSM)** is Oracle Fusion's centralized, task-driven configuration management platform. It replaces the fragmented, module-specific setup forms of Oracle EBS with a unified, role-based, dependency-aware implementation workbench. Every configuration decision in Oracle Fusion Cloud flows through FSM — from enabling Cloud Offerings to exporting configuration packages across environments.

| FSM Capability                           | Description                                                                                                                                                            | Operational Value                                                                                                                       |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Offering Enablement</b>               | Activates entire functional domains (Procurement, Inventory Management, Order Management) and their constituent Functional Areas with a single configuration decision. | Eliminates manual module activation and dependency management. Guided setup prevents orphaned configuration states.                     |
| <b>Implementation Project Management</b> | Creates structured project plans with assigned tasks, responsible parties, due dates, and dependency tracking within the FSM interface.                                | Provides a governance framework for large, multi-stream implementations. Tasks cannot be skipped — dependency enforcement is automatic. |
| <b>Task List Navigation</b>              | Presents all required setup tasks for a given Offering, ordered by dependency, with direct navigation to the relevant configuration page.                              | Eliminates the need to memorize navigation paths. New consultants can execute setups without deep system knowledge.                     |
| <b>Export / Import (CSV &amp; XML)</b>   | Enables configuration export from development, migration to test, and promotion to production via standardized CSV or XML configuration packages.                      | Enforces change management discipline. Eliminates manual re-keying of configuration data across environments.                           |
| <b>Setup Data Comparison</b>             | Compare setup data between two environments (e.g., DEV vs. PROD) before promoting a configuration change.                                                              | Risk mitigation for production changes. Identifies configuration drift between environments.                                            |

| Feature / Aspect              | ★ Oracle Fusion Cloud                                                         | © Oracle EBS (Reference)                                                              |
|-------------------------------|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>Setup Interface</b>        | Unified FSM web interface — all Offerings in one place.                       | Fragmented — each module has its own setup forms (System Administrator, Application). |
| <b>Offering Activation</b>    | One-click activation of entire functional domains with dependency management. | Manual activation per module — no dependency enforcement.                             |
| <b>Configuration Export</b>   | Export/Import configuration packages (CSV/XML) between environments.          | No native config export. Manual re-keying or scripts between instances.               |
| <b>Environment Comparison</b> | Built-in DEV vs PROD setup comparison before promoting changes.               | No native comparison. Requires custom scripts.                                        |
| <b>Task Dependencies</b>      | Automatic dependency enforcement — prerequisite tasks must complete first.    | No dependency enforcement. Incorrect sequence = system errors.                        |

#### 4.1.1 Configuring Offerings — The Activation Sequence

The first action in any Oracle Fusion Cloud implementation is the activation of the relevant Cloud Offerings within FSM. This is not merely a licensing action — it drives the generation of the implementation task list, determines which functional areas are available, and establishes the dependency chain for all downstream setup activities.

#### 4.1.2 SCM-Relevant Offerings and Their Functional Areas

| Oracle Offering                                  | Key Functional Areas                                                        | Primary Modules Activated                          |
|--------------------------------------------------|-----------------------------------------------------------------------------|----------------------------------------------------|
| <b>Manufacturing and Supply Chain Management</b> | Inventory Management, Manufacturing, Shipping Execution, Quality Management | INV, MFG, WSH, QA — Core SCM operations            |
| <b>Procurement</b>                               | Purchasing, Self-Service Procurement, Sourcing, Supplier Qualification      | PO, iProcurement, Sourcing — Procure-to-Pay engine |
| <b>Order Management</b>                          | Order Promising, Shipping, Pricing Management                               | OM, ATP, OSM — Order-to-Cash engine                |
| <b>Financials</b>                                | General Ledger, Payables, Receivables, Fixed Assets, Cash Management        | GL, AP, AR, FA — Financial accounting backbone     |
| <b>Project Portfolio Management</b>              | Project Costing, Billing, Contract Management                               | PA — Capital project and service delivery tracking |

## 4.2 Security Architecture — RBAC vs EBS Responsibilities

◆ BOTH PLATFORMS

**Role-Based Access Control (RBAC)** in Oracle Fusion Cloud operates on a four-tier security model. Unlike EBS's responsibility-based security, which granted or denied access at the application module level, Fusion's RBAC controls access at the individual **function**, **data**, and **page layout** level — simultaneously.

Figure: RBAC Security Model — Oracle Fusion Cloud vs Oracle EBS

| Feature / Aspect   | ★ Oracle Fusion Cloud                                                                    | © Oracle EBS (Reference)                                                          |
|--------------------|------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Security Model     | Role-Based Access Control (RBAC) — 4-tier: Job Role → Duty Role → Privilege → Data Role. | Responsibility-based — coarse module-level access bundles.                        |
| Access Granularity | Atomic privilege level — individual actions (Create Invoice / Approve PO).               | Form-level access — can see a form but not control individual actions.            |
| Data Security      | Row-level data security — user restricted to specific BUs / LEs / Inventory Orgs.        | Limited data security — MOAC for multi-org, but less granular.                    |
| SoD Enforcement    | Native SoD conflict detection in Security Console. Real-time alerts.                     | No native SoD engine. Requires Oracle Advanced Access Controls (AACC) separately. |
| Role Management    | Security Console — visual role hierarchy, user assignment, audit report.                 | User Management / System Administrator forms.                                     |

**Segregation of Duties (SoD)** is the principle that no single individual should control an entire business process from initiation to approval and payment. Oracle Fusion enforces SoD through conflicting role detection in the Security Console — a capability critical for SOX compliance, IFRS audit readiness, and internal control frameworks.

**BEST PRACTICE** During the security design phase, map every Job Role to its SoD conflict matrix before assigning to users. Oracle's native Security Console in Fusion detects conflicts automatically — a capability that required a separate AACC module in EBS.

# Oracle Unified Method (OUM) — The Implementation Lifecycle

*A Field-Tested Framework for Delivering Oracle ERP at Enterprise Scale*

## 5.1 OUM in Context

◆ BOTH PLATFORMS

**Oracle Unified Method (OUM)** is Oracle's official, industrially proven methodology for planning, executing, and governing Oracle technology implementations. It evolved from the Oracle Application Implementation Methodology (AIM) — a framework that defined the EBS implementation era — and was re-engineered for Cloud, Agile, and hybrid deployment models.

OUM is not a theoretical framework. It is a battle-tested operational playbook with specific deliverables, decision gates, and role assignments at each phase. In competitive tenders, demonstrating OUM fluency is often the differentiator between winning and losing enterprise Oracle opportunities.

Figure: Oracle Unified Method (OUM) — 5-Phase Implementation Lifecycle

## 5.2 The Five OUM Phases

◆ BOTH PLATFORMS

| Phase                   | Core Objective                                             | Key Deliverables                                                                              | Fusion vs EBS Difference                                                                                     |
|-------------------------|------------------------------------------------------------|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>1 — Inception</b>    | Define scope, business case, and governance.               | Project Charter, Scope Statement, Stakeholder Register, Risk Register, Business Case.         | Fusion: Cloud subscription model simplifies business case. EBS: Include infrastructure procurement in scope. |
| <b>2 — Elaboration</b>  | Analyze requirements, design future-state solution.        | Fit-Gap Analysis, To-Be Process Maps, Solution Design, CRP Sessions, Data Migration Strategy. | Fusion: Fewer Gaps due to cloud feature richness. EBS: More custom development in Solution Design.           |
| <b>3 — Construction</b> | Build, configure, and unit-test the designed solution.     | System Configuration, Integration Build, Data Migration Scripts, Unit Test Results.           | Fusion: No infrastructure setup. EBS: Server provisioning, patching, and environment build in this phase.    |
| <b>4 — Transition</b>   | UAT, training, final data migration, and Go-Live.          | UAT Sign-Off, Training Completion, Cutover Plan, Production Setup, Go-Live.                   | Fusion: Quarterly upgrade awareness required. EBS: Full regression testing required post-patching.           |
| <b>5 — Production</b>   | Stabilize production and transition to support operations. | Hypercare Support, Knowledge Transfer, Post-Implementation Review.                            | Both: Hypercare 60–90 days. Fusion: Monitor quarterly upgrade impact. EBS: Monitor patch bundles.            |

## 5.3 Fit-Gap Analysis — The Commercial Core of OUM

### ◆ BOTH PLATFORMS

**Fit-Gap Analysis** is the structured methodology for comparing Oracle Fusion's standard capabilities against the client's documented business requirements. It is the single most commercially significant deliverable in the Elaboration phase — every Gap identified carries a cost implication, and every incorrect Fit classification carries a scope risk.

| Classification             | Definition                                                     | Action                                                    | Commercial Impact                                            |
|----------------------------|----------------------------------------------------------------|-----------------------------------------------------------|--------------------------------------------------------------|
| <b>Full Fit</b>            | Oracle standard configuration fully addresses the requirement. | Accept Oracle's standard process. Document configuration. | No additional cost. Reduces upgrade risk. Preferred outcome. |
| <b>Partial Fit</b>         | Oracle covers 60–90% of the requirement.                       | Document workaround. Obtain client acceptance.            | Low cost. Client must formally accept the delta.             |
| <b>Gap — Configuration</b> | Addressable through Flexfield, workflow, or additional setup.  | Design config-based solution. No custom code.             | Moderate effort. Low risk. Included in standard scope.       |
| <b>Gap — Extension</b>     | Requires Oracle-approved extensibility (VBCS, BIP, OIC).       | Fusion: VBCS / OIC extension. EBS: OAF /                  | Significant cost. Upgrade consideration.                     |

|                             |                                                                                        |                                                                                     |                                                                 |
|-----------------------------|----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-----------------------------------------------------------------|
|                             |                                                                                        | Forms personalization.<br>Raise Change Request.                                     |                                                                 |
| <b>Gap — Process Change</b> | Requirement reflects a sub-optimal business process.<br>Oracle's standard is superior. | Present Oracle standard.<br>Quantify benefit.<br>Recommend business process change. | Zero cost. Highest potential value. Requires Change Management. |

**Expert Perspective:** In more than a decade of Fit-Gap workshops across 40+ enterprise implementations, the most consistently underutilized classification is "Gap — Process Change." Clients arrive with deeply ingrained processes that their teams have executed for years. The experienced Oracle architect's role is to demonstrate that Oracle's standard process is not a limitation — it is a best practice refined across thousands of global implementations. Achieving alignment here is the highest-value activity in the entire engagement.

## 5.4 Cutover Planning — The Surgical Execution

### ◆ BOTH PLATFORMS

Cutover is the most operationally critical — and most frequently under-planned — phase of an Oracle implementation. A well-executed cutover plan is measured in hours, not days, and requires rehearsal, rehearsal, and rehearsal.

| Milestone          | Activity                                                                                                                     | Owner                                    | Completion Criteria                                                                 |
|--------------------|------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|-------------------------------------------------------------------------------------|
| <b>T-30 Days</b>   | Freeze all configuration changes in Production environment. Establish Change Control Board approval for any exceptions.      | Solution Architect                       | Signed Configuration Freeze Certificate. Change Control Board formally constituted. |
| <b>T-14 Days</b>   | Cutover Dress Rehearsal #1: Execute full cutover sequence in UAT environment. Measure elapsed time for each step.            | Technical Lead + Functional Leads        | Dress Rehearsal #1 Results Report. Risk log updated with timing variances.          |
| <b>T-7 Days</b>    | Cutover Dress Rehearsal #2: Incorporate lessons from DR#1. All teams confirm readiness. Cutover Checklist finalized.         | All Stream Leads                         | Signed Cutover Readiness Sign-Off. Go/No-Go decision documented.                    |
| <b>T-3 Days</b>    | Legacy system closure: Block new transactions in legacy ERP. Final data extracts for migration. Open balance reconciliation. | Finance Controller + Data Migration Lead | Legacy System Close Report. Reconciliation sign-off by Finance Director.            |
| <b>T-0 Go-Live</b> | Production configuration validation. Final data load execution. Smoke testing. User                                          | Project Manager + Solution Architect     | Go-Live Readiness Checklist 100% complete. Hypercare team activated.                |

|                         |                                                                                                           |                     |                                                                                                |
|-------------------------|-----------------------------------------------------------------------------------------------------------|---------------------|------------------------------------------------------------------------------------------------|
|                         | access activation. Go-Live declaration.                                                                   |                     |                                                                                                |
| <b>T+1 through T+30</b> | Hypercare: dedicated support team on-site or on-call. Incident triage and resolution. Daily status calls. | Hypercare Team Lead | Daily Incident Log. Escalation matrix activated. Priority 1 incidents resolved within 4 hours. |

## CH. 06

# Core Business Process Flows — P2P and O2C

*Procure-to-Pay and Order-to-Cash with Oracle Module Mapping*

## 6.1 Procure-to-Pay (P2P) — From Requisition to Payment

### ► ORACLE FUSION CLOUD

The Procure-to-Pay (P2P) cycle is Oracle's foundational procurement and payables workflow. It spans six functional modules and culminates in the 3-Way Match — Oracle's automated control mechanism that validates payment authorization only when three documents are aligned: the Purchase Order, the Goods Receipt, and the Supplier Invoice.

Figure: Procure-to-Pay End-to-End Flow — Oracle Fusion Cloud with 3-Way Match

| Step | Process Activity                                                                                          | Oracle Fusion Module                                     | EBS Equivalent Module                       |
|------|-----------------------------------------------------------------------------------------------------------|----------------------------------------------------------|---------------------------------------------|
| 1    | Purchase Requisition: Internal request with approval hierarchy, budget check, and catalog-based ordering. | Oracle Self-Service Procurement (iProcurement in Fusion) | Oracle iProcurement / Purchase Requisitions |
| 2    | Purchase Order: Legally binding supplier                                                                  | Oracle Procurement Cloud                                 | Oracle Purchasing (PO module)               |

|   |                                                                                                            |                                       |                                       |
|---|------------------------------------------------------------------------------------------------------------|---------------------------------------|---------------------------------------|
|   | commitment. Standard, Blanket, or Contract PO types. AME approval workflow.                                |                                       |                                       |
| 3 | Goods Receipt: Physical acknowledgment. 3-Way Match prerequisite. Quality inspection routing.              | Oracle Receiving (Fusion Procurement) | Oracle Receiving (PO Receiving)       |
| 4 | Supplier Invoice: Auto-matched against PO and Receipt. Oracle Tax calculation. Invoice tolerance controls. | Oracle Payables Cloud (AP)            | Oracle Payables (AP)                  |
| 5 | Payment: Payment Terms enforcement, EFT/SWIFT/Check. Dynamic Discounting (early payment incentives).       | Oracle Payments Cloud                 | Oracle Payments                       |
| 6 | Accounting & GL: SLA-driven automated journal entries. GRIR clearing. AP Reconciliation.                   | Oracle SLA → General Ledger Cloud     | Oracle SLA (limited) → General Ledger |

| Feature / Aspect             | ★ Oracle Fusion Cloud                                                      | © Oracle EBS (Reference)                                         |
|------------------------------|----------------------------------------------------------------------------|------------------------------------------------------------------|
| <b>Invoice Capture</b>       | AI-powered OCR invoice capture — supplier PDFs auto-extracted and matched. | Manual data entry. No native OCR. Requires third-party tools.    |
| <b>Mobile Requisitioning</b> | Full mobile-responsive UI in Oracle Redwood experience.                    | No native mobile support. Requires additional OAF customization. |
| <b>Supplier Portal</b>       | Native Supplier Self-Service portal for invoice submission and status.     | Requires iSupplier Portal module — separate licensing.           |
| <b>Contract Compliance</b>   | AI alerts for spend deviating from Blanket Agreement terms.                | Manual compliance checking — no AI-driven monitoring.            |

## 6.2 Order-to-Cash (O2C) — From Customer Order to Cash Receipt

### ► ORACLE FUSION CLOUD

| Step | Process Activity                                                                                     | Oracle Fusion Module                         | Key Controls                                         |
|------|------------------------------------------------------------------------------------------------------|----------------------------------------------|------------------------------------------------------|
| 1    | Sales Order Entry: Customer order with pricing, Credit Check, ATP verification, and Hold Management. | Oracle Order Management Cloud                | Price Book, Pricing Rules, Credit Limits, ATP logic. |
| 2    | Order Promising: Real-time inventory commitment. Available-to-Promise and Capable-to-Promise logic.  | Oracle Global Order Promising (GOP)          | ATP vs. CTP routing. Drop-Ship order management.     |
| 3    | Pick, Pack, Ship: Physical fulfillment. Pick Wave generation. Bill of Lading. Carrier integration.   | Oracle Inventory + Oracle Shipping Execution | Pick Slip, Packing Slip, Freight cost calculation.   |
| 4    | Sales Invoice: Auto-invoicing on shipment. Revenue recognition scheduling per IFRS 15 / ASC 606.     | Oracle Receivables Cloud (AR)                | AutoInvoice rules, Credit Memo for returns, Tax.     |
| 5    | Cash Application: AutoLockbox for bulk bank statement processing. Automated remittance matching.     | Oracle Receivables + Oracle Cash Management  | Deduction management, Bank reconciliation.           |
| 6    | Collections: Dunning Letters, Payment Promise, DSO analytics, Dispute Resolution workflows.          | Oracle Advanced Collections                  | DSO tracking, Dispute resolution, Legal escalation.  |

CH.  
**07**

## Data Migration Strategy — ETL, Cleansing & Load Architecture

*The Most Underestimated and Most Critical Phase of Any ERP Implementation*

### 7.1 Strategic Significance of Data Migration

◆ BOTH PLATFORMS

According to Panorama Consulting's annual ERP Research Report, data migration challenges are cited as the primary cause of schedule delays in 48% of ERP implementations and the primary driver of budget overruns in 41% of projects. Despite this, data migration is routinely under-resourced, under-planned, and under-prioritized relative to system configuration activities.

**The architectural reality:** Oracle Fusion Cloud does not repair poor-quality data — it amplifies its consequences. An incorrect supplier record in EBS becomes a tax reporting error, a payment routing failure, and a VAT filing discrepancy simultaneously in Fusion. The quality of the data entering the system on Day 1 is the single most reliable predictor of Go-Live success.

Figure: Data Migration 6-Stage ETL Framework — Oracle Fusion Cloud

### 7.2 The 6-Stage Data Migration Methodology

◆ BOTH PLATFORMS

| Stage                                      | Activity and Deliverable                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Stage 1: Data Audit &amp; Profiling</b> | Catalog every data domain: Suppliers, Customers, Items, Open POs, Open Invoices, On-Hand Inventory, Fixed Assets, CoA, Historical Transactions. Execute SQL profiling queries for record counts, null rates, duplicate rates, and referential integrity violations. Deliverable: Data Inventory Report with quality baseline scores. |

|                                                  |                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Stage 2: Cleansing Rules Definition</b>       | Transform profiling findings into actionable rules assigned to Business Data Owners (not IT). Example: "All supplier records missing Tax Registration Number must be updated by the Accounts Payable Manager by [Date]." Deliverable: Data Cleansing Rules Specification — signed by the Data Owner.        |
| <b>Stage 3: Data Mapping</b>                     | Field-by-field specification from source system to Oracle Fusion target, including transformation logic (type conversions, date formats, lookup translations). Deliverable: Data Mapping Workbook (one per data domain).                                                                                    |
| <b>Stage 4: ETL Build &amp; Testing</b>          | Build the Extract-Transform-Load pipeline (Oracle Data Integrator, FBDI-compatible CSV scripts, or Python). Unit-test on 10% sample data. Validate transformation accuracy and record completeness. Deliverable: ETL Package with documented test results.                                                  |
| <b>Stage 5: Mock Migration (3x Minimum)</b>      | Execute full migration in a dedicated migration test environment — minimum three dress rehearsals. Measure elapsed time, capture rejection rates, reconcile counts and values. Deliverable: Mock Migration Results Report with elapsed time log for Cutover sizing.                                         |
| <b>Stage 6: Production Load &amp; Validation</b> | Execute final load within Cutover window. Immediately execute automated reconciliation scripts. Any discrepancy above pre-defined tolerance triggers investigation — never proceed to Go-Live with unreconciled data. Deliverable: Production Load Reconciliation Certificate signed by Finance Controller. |

## 7.3 Oracle FBDI — File-Based Data Import

### ► ORACLE FUSION CLOUD

**File-Based Data Import (FBDI)** is Oracle's primary mechanism for bulk data loading into Oracle Fusion Cloud. FBDI leverages Oracle-published CSV templates to load data via Oracle WebCenter Content (UCM) and scheduled processes — without requiring direct database access, API calls, or custom integration.

| FBDI Process Step                         | Technical Detail                                                                                                                                                                                                                       | Common Failure Mode & Resolution                                                                                                   |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>1. Download Official FBDI Template</b> | Obtain the Oracle-published FBDI spreadsheet template for the specific data domain from Oracle's documentation portal (docs.oracle.com). Each quarterly Oracle release may include template updates — always use the current template. | Using outdated templates: Causes header validation failures. Always download fresh templates at the start of each migration cycle. |
| <b>2. Populate Staging Data</b>           | Populate the FBDI template's Worker sheets with source data. Required fields must be 100% populated. Lookup fields must contain valid Oracle Fusion reference values — not source system values.                                       | Invalid lookup values: The most common rejection cause. Build a lookup translation mapping table before populating FBDI.           |
| <b>3. Upload to UCM</b>                   | Zip the completed CSV files and upload via Oracle Fusion's File Import and Export                                                                                                                                                      | File size limit (varies by template, typically 500MB compressed). Split large loads into batches.                                  |

|                                     |                                                                                                                              |                                                                                                                                                                            |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                     | work area, or via the UCM web interface at /cs/idcplg.                                                                       |                                                                                                                                                                            |
| <b>4. Submit Import Process</b>     | Navigate to the relevant Scheduled Process and submit with the uploaded file reference. Monitor process status.              | Process submits but immediately errors: Usually a file format or encoding issue. Validate CSV structure using Oracle's published validation rules.                         |
| <b>5. Review and Correct Errors</b> | Download the Import Exception Report. Each exception includes the Row Number, Field Name, Error Code, and Error Description. | Mass failures with generic error messages: Indicates a structural problem (wrong template version). Fix the root cause, not individual rows.                               |
| <b>6. Reconcile Loaded Data</b>     | Execute reconciliation queries or OTBI reports comparing source record counts and key values against loaded Oracle data.     | Reconciliation discrepancy: Never proceed to Go-Live with unreconciled data. Investigate every exception — even small variances can indicate systemic data quality issues. |

### 7.3.1 The 5 Dimensions of Data Quality

| Quality Dimension   | Definition                                                                                                                       | Oracle Validation Method                                                                        | Failure Consequence                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Completeness</b> | All mandatory fields populated for every record in the dataset.                                                                  | FBDI mandatory field validation. Pre-load SQL completeness queries.                             | Load rejection at the field level. Manual correction required for every incomplete record.       |
| <b>Uniqueness</b>   | No duplicate records within a data domain. One supplier = one supplier master record.                                            | Pre-load deduplication query. Oracle Supplier Merge post-load for residual duplicates.          | Duplicate supplier records = split payment history, dual tax reporting, reporting inconsistency. |
| <b>Validity</b>     | All values conform to Oracle Fusion's reference data standards (ISO codes, UOM codes, currency codes, unit of measure).          | Lookup table cross-reference validation before FBDI population.                                 | Rejected rows. Manual lookup translation required at scale.                                      |
| <b>Consistency</b>  | Referential integrity maintained across data domains — Items exist in Item Master before being referenced in Inventory Balances. | Load sequence governance: Master data before transactional data. Dependency validation scripts. | Orphaned transaction records with no parent master. Reconciliation failures post-load.           |
| <b>Accuracy</b>     | Values accurately reflect the real-world state of business                                                                       | Business data owner sign-off on spot-check sample.                                              | Incorrect opening balances result in                                                             |

|  |                                          |                                                     |                                                                  |
|--|------------------------------------------|-----------------------------------------------------|------------------------------------------------------------------|
|  | assets as of the migration cutover date. | Finance controller reconciliation of open balances. | financial restatements, audit findings, and regulatory exposure. |
|--|------------------------------------------|-----------------------------------------------------|------------------------------------------------------------------|

**CAUTION** Garbage In = Garbage Out. Oracle Fusion does not sanitize, normalize, or default poor-quality source data. Allocate a minimum of 25–30% of the total project budget to data discovery, cleansing, and migration activities. Clients who resist this investment consistently experience Go-Live failures and post-production reconciliation crises that consume multiples of the avoided migration budget.

| Feature / Aspect             | ★ Oracle Fusion Cloud                                         | © Oracle EBS (Reference)                                                       |
|------------------------------|---------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>Load Mechanism</b>        | FBDI (CSV templates via UCM) + REST APIs for real-time loads. | SQL*Loader, Open Interfaces, custom PL/SQL scripts. Direct DB access required. |
| <b>Technical Requirement</b> | No database access. Business team can manage templates.       | Requires DBA and developer access for direct DB loads.                         |
| <b>Error Handling</b>        | Exception report with row-level error codes and field names.  | Custom error handling required per interface.                                  |
| <b>Template Management</b>   | Oracle-published templates updated quarterly with releases.   | Custom interface tables — customer-managed.                                    |

**CAUTION** Using outdated FBDI templates is the #1 cause of load rejection in Fusion Cloud migrations. Always download fresh templates from docs.oracle.com at the start of each migration cycle.

# Modern Integration Architecture — REST, SOAP & Oracle Integration Cloud

*Building the Connected Enterprise: Oracle Fusion in the Digital Ecosystem*

## 8.1 Integration Architecture Overview

► ORACLE FUSION CLOUD

Oracle Fusion Cloud operates within a broader enterprise technology ecosystem. In every enterprise implementation, Fusion coexists with specialized systems — Warehouse Management Systems (WMS), Transportation Management Systems (TMS), CRM platforms, Legacy ERP modules, HR systems, and Industry-specific applications. The integration architecture that connects these systems is as strategically significant as the Oracle configuration itself.

A poorly designed integration architecture introduces data latency, creates reconciliation nightmares, and undermines the Single Source of Truth principle that justifies the ERP investment. A well-designed integration architecture transforms the ERP from a monolithic application into the intelligent hub of a composable enterprise.

Figure: Oracle Integration Cloud (OIC) Hub Architecture — Connected Enterprise

| Feature / Aspect     | ★ Oracle Fusion Cloud                                                    | © Oracle EBS (Reference)                                                  |
|----------------------|--------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Integration Platform | Oracle Integration Cloud (OIC) — fully managed iPaaS. No infrastructure. | Oracle SOA Suite / OSB — on-premise middleware. Customer-managed servers. |

|                          |                                                                                        |                                                                            |
|--------------------------|----------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| <b>Adapter Library</b>   | 200+ pre-built adapters. REST, SOAP, File, DB, ERP Cloud, HCM, Salesforce, SAP.        | Custom BPEL/OSB adapters. Significant development effort per integration.  |
| <b>Design Experience</b> | Visual low-code flow designer — drag-and-drop. Functional consultants can participate. | XML/BPEL/WSDL code development. Requires Java/Oracle Middleware expertise. |
| <b>Business Events</b>   | Native subscription to Oracle Fusion Business Events (PO Approved, Invoice Paid).      | Custom triggers via database event queues or custom API calls.             |
| <b>Monitoring</b>        | Real-time OIC dashboard — message tracking, error drilling, re-submission.             | Oracle Enterprise Manager + custom monitoring dashboards.                  |
| <b>Cost Model</b>        | Subscription-based — scales with message volume. No infrastructure cost.               | Capital expenditure — servers, licenses, DBA, middleware administrators.   |

## 8.2 Integration Patterns

### ◆ FOUNDATIONAL LEVEL

| Pattern                          | Architecture                                                                                                       | When to Use                                                                                        | Oracle Recommendation                                                                                    |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Point-to-Point</b>            | Direct API connection between two systems. System A calls System B's endpoint directly.                            | Proof-of-concept. Two-system integration with no anticipated expansion.                            | Avoid for production: Creates a spaghetti integration architecture that becomes unmanageable with scale. |
| <b>Hub-and-Spoke (ESB)</b>       | All integrations route through a central middleware hub. Oracle Integration Cloud is Oracle's ESB platform.        | Enterprise deployments with 5+ integrated systems. Requires centralized monitoring and governance. | Recommended standard for all enterprise Oracle Fusion deployments.                                       |
| <b>Event-Driven Architecture</b> | System A publishes an event (e.g., "PO Approved"). Subscribed systems consume and act on the event asynchronously. | Real-time data synchronization. Decoupled systems requiring near-real-time consistency.            | Supported natively via Oracle Business Events and OIC Event-Based subscriptions.                         |
| <b>Batch / File-Based</b>        | Data exchanged as scheduled file transfers (CSV, XML, EDI). No real-time API interaction.                          | High-volume data exchanges where real-time latency is not required. Legacy system integration.     | Supported via Oracle's File Adapter in OIC. SFTP / FTP / UCM file staging.                               |

## 8.3 Oracle Fusion REST API Reference

### ► ORACLE FUSION CLOUD

Oracle Fusion Cloud exposes a **comprehensive REST API surface** covering virtually every business object in the application. REST APIs follow the OData standard, support JSON payloads, and use standard HTTP methods — making them accessible to any modern integration platform or development language.

| Business Object          | REST Endpoint Fragment | Key HTTP Methods   | Common Integration Use Case                                     |
|--------------------------|------------------------|--------------------|-----------------------------------------------------------------|
| <b>Purchase Orders</b>   | /purchaseOrders        | GET   POST   PATCH | WMS → Fusion: Create PO from warehouse replenishment request.   |
| <b>Receiving</b>         | /receivingReceipts     | POST   GET         | WMS → Fusion: Post goods receipt from WMS confirmation.         |
| <b>Inventory On-Hand</b> | /inventoryBalances     | GET                | E-Commerce → Fusion: Real-time stock availability check.        |
| <b>Suppliers</b>         | /suppliers             | GET   POST   PATCH | MDM → Fusion: Supplier master synchronization.                  |
| <b>Sales Orders</b>      | /salesOrders           | POST   GET         | CRM → Fusion: Create sales order from CRM opportunity.          |
| <b>Item Master</b>       | /items                 | GET   POST   PATCH | PLM → Fusion: New product introduction from engineering system. |

### 8.3.1 REST API Architecture

| API Attribute           | Specification                                                       | Notes                                                                                                                 |
|-------------------------|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Base URL Pattern</b> | https://[pod-name].oraclecloud.com/fscmRestApi/resources/[version]/ | Version follows Oracle's quarterly release format: 11.13.18.05                                                        |
| <b>Authentication</b>   | OAuth 2.0 (recommended)   Basic Authentication (development only)   | OAuth 2.0 with Client Credentials Grant Type is the production security standard. Never use Basic Auth in production. |
| <b>Response Format</b>  | JSON (default)   XML (via Accept header)                            | JSON responses include metadata links, item arrays, and pagination tokens.                                            |

|                       |                                                                                                                             |                                                                                                              |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>HTTP Methods</b>   | GET (retrieve)   POST (create)   PATCH (update)   DELETE (delete)                                                           | PATCH updates only specified fields. DELETE is restricted to soft-delete-capable objects.                    |
| <b>Pagination</b>     | limit and offset query parameters. Default limit: 25 records. Maximum: 500.                                                 | For bulk retrieval, implement pagination loops. Never assume all records returned in a single response.      |
| <b>Error Handling</b> | HTTP status codes: 200 (success), 201 (created), 400 (bad request), 401 (unauthorized), 404 (not found), 500 (server error) | Error response body contains detailed error code and message. Log full response body — not just HTTP status. |

## 8.4 Oracle Integration Cloud (OIC) — The Enterprise Integration Platform

**Oracle Integration Cloud (OIC)** is Oracle's fully managed, cloud-native iPaaS (Integration Platform as a Service) solution. OIC provides a visual, low-code integration design environment backed by a comprehensive library of pre-built adapters, enabling enterprise-grade integration without the infrastructure overhead of traditional middleware platforms like Oracle SOA Suite or IBM MQ.

| OIC Capability                      | Description                                                                                                                                                                                 | Value Proposition                                                                                                             |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Pre-Built Oracle Adapters</b>    | Oracle ERP Cloud Adapter, Oracle SCM Cloud Adapter, HCM Cloud Adapter — purpose-built for Fusion Cloud APIs with built-in authentication, error handling, and business event subscriptions. | Eliminates 70–80% of the integration development effort for standard Fusion Cloud integration patterns.                       |
| <b>Third-Party Adapters</b>         | 200+ pre-built adapters: Salesforce, SAP, Workday, ServiceNow, Shopify, Amazon S3, SFTP, REST Generic, SOAP Generic, Database Adapter.                                                      | Connect Oracle Fusion to virtually any enterprise system without bespoke adapter development.                                 |
| <b>Visual Flow Designer</b>         | Drag-and-drop integration flow design with built-in data mapping, transformation (XSL/JavaScript), routing, looping, and error handling.                                                    | Reduces integration development time from weeks to days. Enables functional consultants to participate in integration design. |
| <b>Business Event Subscriptions</b> | Subscribe to Oracle Fusion Business Events (e.g., PO Approval, Goods Receipt, Invoice Payment) and trigger downstream integration flows automatically.                                      | Enables real-time, event-driven integration without polling — reducing system load and data latency simultaneously.           |

|                                       |                                                                                                                               |                                                                                                                 |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Process Automation (OPA)</b>       | Low-code business process automation: approval workflows, document routing, notifications, and human task management.         | Automate complex multi-system business processes that span Oracle Fusion and third-party applications.          |
| <b>Monitoring &amp; Observability</b> | Real-time integration flow monitoring, message tracking, error drilling, and re-submission capability from the OIC dashboard. | Full operational visibility into every integration message. Critical for production support and SLA compliance. |

# Reporting, Analytics & AI Insights

OTBI · BI Publisher · Embedded Analytics · Oracle AI — The Intelligent ERP

## 9.1 The Oracle Analytics Ecosystem

### ► ORACLE FUSION CLOUD

Oracle Fusion Cloud's reporting and analytics capabilities span from real-time transactional reports to predictive AI insights. Understanding which tool to deploy for which requirement is as architecturally important as the underlying data model. Deploying the wrong reporting tool creates performance problems, user adoption failures, and data accuracy concerns.

Figure: Oracle Fusion Cloud Analytics Ecosystem — OTBI, BIP, OAC, Infolets

| Feature / Aspect                | ★ Oracle Fusion Cloud                                                                         | © Oracle EBS (Reference)                                                     |
|---------------------------------|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
| <b>OTBI (Real-Time Reports)</b> | Native embedded. Self-service drag-and-drop. Subject Area model. No separate BI installation. | Discoverer / OBIEE — required separate server setup and DBA configuration.   |
| <b>BI Publisher (Documents)</b> | Embedded BIP engine. RTF templates. Bursting to email/FTP. Regulatory reports.                | Oracle XML Publisher (same concept) — required separate BI Publisher server. |
| <b>Analytics Platform</b>       | Oracle Analytics Cloud (OAC) — cloud-native ML-enabled BI.                                    | Oracle OBIEE — on-premise, infrastructure-heavy, complex upgrade path.       |
| <b>Home Page KPIs</b>           | Embedded Infolets — real-time KPI tiles in Oracle Redwood UI. No report required.             | Not available natively. Required custom OAF dashboards.                      |
| <b>AI-Powered Analytics</b>     | Fusion Copilot, natural language query, predictive insights embedded in screens.              | No AI layer. Static reports and manual analysis.                             |

## 9.2 Key OTBI Subject Areas for SCM

### ► ORACLE FUSION CLOUD

| Subject Area                                        | Data Domain                              | Key Metrics                                                                               |
|-----------------------------------------------------|------------------------------------------|-------------------------------------------------------------------------------------------|
| <b>Procurement — Purchasing Real Time</b>           | POs, Requisitions, Supplier Agreements   | PO Value by Supplier/Category/Period, Requisition-to-PO Cycle Time, Spend by Cost Center. |
| <b>Inventory — Inventory Balances Real Time</b>     | On-Hand Inventory, Lot/Serial Tracking   | Inventory Value by Org/Item/Category, Inventory Turnover, Days on Hand, Stock Coverage.   |
| <b>Inventory — Inventory Transactions Real Time</b> | Receipts, Issues, Transfers, Adjustments | Transaction Volume by Type, Adjustment Value Analysis, Receipt-to-PO Match Rate.          |
| <b>Order Management — Order Lines Real Time</b>     | Sales Orders, Shipments, Pricing         | Order Backlog, On-Time Delivery Rate, Revenue by Customer/Product.                        |
| <b>Payables — Invoices Real Time</b>                | AP Invoices, Payments, Aging             | Invoice Processing Cycle Time, Payment Terms Compliance, DPO (Days Payable Outstanding).  |

## 9.3 Oracle AI & Machine Learning — Fusion Cloud 2025

### ► ORACLE FUSION CLOUD

Oracle has embedded AI and ML capabilities across Fusion Cloud's operational modules — production-grade, active within standard subscriptions, requiring only configuration activation.

| AI Capability                   | Module             | Mechanism                                                                                                   | Demonstrated Business Value                                                            |
|---------------------------------|--------------------|-------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Intelligent Sourcing</b>     | Procurement        | ML recommends optimal suppliers based on performance history, contract compliance, and pricing deviation.   | 8–15% procurement cost reduction through AI-directed supplier consolidation.           |
| <b>Smart Receiving (OCR)</b>    | SCM / AP           | AI + OCR extracts invoice data from PDFs, validates against PO, routes exceptions automatically.            | 60–75% reduction in invoice processing touchpoints. Near-zero keying errors.           |
| <b>Demand Forecasting</b>       | Inventory Planning | ML integrates sales history, market signals, weather, and promotions for daily demand updates.              | 15–25% reduction in excess inventory. Improved service levels with lower safety stock. |
| <b>Anomaly Detection</b>        | Financial Controls | Monitors AP/GL/Expense transactions — flags statistical anomalies for fraud and duplicate payments.         | Proactive fraud detection. Reduced external audit findings. SOX automation.            |
| <b>AI-Powered Approvals</b>     | Workflow (BPM)     | Learns approval patterns and auto-routes routine transactions without manual intervention.                  | 30–50% reduction in approval cycle time for routine transactions.                      |
| <b>Fusion Copilot (2024-25)</b> | All Modules        | Generative AI — summarizes transaction data, suggests next actions, generates reports via natural language. | 40% reduction in time to complete complex multi-step processes. Higher data accuracy.  |

**The Oracle Fusion Copilot (2024–2025):** Oracle's strategic AI initiative embeds generative AI capabilities — summarization, recommendation, and next-best-action guidance — directly into Fusion Cloud's transactional screens. Early adopters report a 40% reduction in the time required to navigate complex multi-step processes, and a measurable improvement in data entry accuracy through AI-assisted field completion.

## Organizational Change Management & User Adoption

*The Human Architecture of a Successful Oracle ERP Implementation*

### 10.1 Why Technical Success Is Not Enough

**◆ BOTH PLATFORMS**

Gartner: 60–75% of ERP projects that meet technical milestones fail to achieve projected business value within 2 years. Root cause in the majority: inadequate organizational change management and insufficient user adoption strategy — not technical deficiency.

### 10.2 The ADKAR Framework Applied to Oracle Implementations

**◆ BOTH PLATFORMS**

| ADKAR Element            | Implementation Strategy                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>A — Awareness</b>     | Stakeholders at every level must understand WHY. Not "we are implementing Oracle" — but "Oracle will eliminate our 14-day close, reduce procurement cycle from 21 to 7 days, and give us real-time inventory across all 8 warehouses." Awareness campaigns begin before kick-off, not at Go-Live. |
| <b>D — Desire</b>        | Every user and manager must see WIIFM (What's In It For Me). Build desire through co-design workshops, early involvement, and demonstrating Quick Wins from CRP1. Procurement clerks see fewer corrections. Managers see better dashboards. Finance sees faster close.                            |
| <b>K — Knowledge</b>     | Role-based training in the actual system configuration — not a generic demo environment. Training must simulate the exact business scenarios each user will encounter on Day 1. Supplement with job aids and Quick Reference Cards for each user's top 10 daily transactions.                     |
| <b>A — Ability</b>       | Knowledge without hands-on practice produces incompetent Day 1 users. Build ability through supervised practice in a Training environment loaded with representative business data. Minimum: two full production-simulation sessions per user group in the 2 weeks before Go-Live.                |
| <b>R — Reinforcement</b> | Hypercare period: Super Users embedded in each business unit provide floor-level support. Weekly performance dashboards published during first 90 days. Post-Go-Live training refreshers at 30 and 90 days address real-world questions that only emerge from live system use.                    |

## 10.3 Top 10 Implementation Failure Patterns

### ◆ BOTH PLATFORMS

| #  | Failure Pattern                           | Root Cause                                                                      | Prevention Strategy                                                                         |
|----|-------------------------------------------|---------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| 1  | Skipping Conference Room Pilot (CRP)      | Perceived time pressure. Underestimation of risk-identification value.          | CRP is mandatory. Gaps found in CRP cost 5–10x less than identical gaps found in UAT.       |
| 2  | Enterprise Structure designed too quickly | Pressure to configure before organizational analysis is complete.               | Mandatory Enterprise Structure Design Workshop (min. 3 days) before any configuration.      |
| 3  | Customization over Configuration          | Client insists on replicating legacy processes exactly.                         | Quantify long-term TCO of customization: licensing, upgrade disruption, support burden.     |
| 4  | Data Migration deferred to end            | Perceived as "just loading data." Technically and commercially underestimated.  | Data Migration begins Week 1. Dedicated workstream with executive sponsorship.              |
| 5  | Insufficient User Training                | Training budget cut to recover schedule slippage.                               | Training budget contractually protected. Metrics reported to Steering Committee weekly.     |
| 6  | Underpowered Cutover Plan                 | Created late. Treated as checklist, not engineered execution.                   | Cutover planning in Construction phase. Two full dress rehearsals minimum.                  |
| 7  | Integration not tested end-to-end         | Integration tested in isolation per system — not as a chain.                    | End-to-end integration testing with production-representative data volumes under peak load. |
| 8  | No Super User program                     | Super User role not formally defined. Floor-level support expected organically. | Formally identify, train, and empower Super Users (one per department) from Month 1.        |
| 9  | Project closed immediately after Go-Live  | Team disbanded before stabilization. Hypercare treated as afterthought.         | Hypercare 60–90 days formalized in project contract. Team resourcing maintained.            |
| 10 | No Post-Implementation Review             | Success declared at Go-Live. No measurement of value realization.               | Mandatory PIR at 90 days and 12 months. Measure against original Business Case ROI model.   |

# Career Architecture & Oracle Certification Roadmap

Professional Development Framework for Oracle ERP Practitioners

## 11.1 Oracle ERP Career Tracks

◆ BOTH PLATFORMS

| Career Track          | Core Competencies (Fusion Focus)                                               | EBS Relevance                                                 |
|-----------------------|--------------------------------------------------------------------------------|---------------------------------------------------------------|
| Functional Consultant | Oracle Fusion module config, Fit-Gap, UAT, Business Process redesign, FSM.     | EBS functional knowledge valued for migration projects.       |
| Technical Consultant  | REST APIs, OTBI/BIP, OIC integration design, VBCS, SQL/PL-SQL.                 | EBS: OAF, Forms, PL-SQL development. Transferable SQL skills. |
| Solution Architect    | Enterprise architecture, multi-module integration, pre-sales, team leadership. | EBS architecture knowledge aids migration solutioning.        |
| Project Manager (OUM) | OUM methodology, project planning, risk management, client advisory.           | OUM applies to EBS projects equally.                          |
| Data Architect        | FBDI, REST API loads, data governance, ETL design, reconciliation frameworks.  | EBS: SQL*Loader, Open Interfaces. Concept transferable.       |

## 11.2 Oracle Certification Roadmap

► ORACLE FUSION CLOUD

| Level       | Certification                                                    | Domain         | Priority for Fusion Practitioners                 |
|-------------|------------------------------------------------------------------|----------------|---------------------------------------------------|
| Foundations | Oracle Cloud Infrastructure 2024 Foundations Associate           | Cloud Platform | Essential — baseline cloud architecture knowledge |
| Associate   | Oracle Fusion Cloud SCM 2024 Certified Implementation Specialist | SCM Functional | ★ Primary certification for SCM consultants       |

|                     |                                                                          |                     |                                                          |
|---------------------|--------------------------------------------------------------------------|---------------------|----------------------------------------------------------|
| <b>Associate</b>    | Oracle Fusion Cloud Financials 2024 Certified Implementation Specialist  | Finance Functional  | ★ Essential complement — the 4 C's are Finance territory |
| <b>Associate</b>    | Oracle Fusion Cloud Procurement 2024 Certified Implementation Specialist | Procurement         | Recommended for P2P specialists                          |
| <b>Professional</b> | Oracle Fusion Cloud ERP 2024 Certified Implementation Professional       | ERP Full Suite      | Advanced — spanning multiple modules                     |
| <b>Specialist</b>   | Oracle Integration Cloud 2024 Specialist                                 | OIC / Technical     | ★ Required for integration-focused consultants           |
| <b>Specialist</b>   | Oracle Analytics Cloud 2024 Specialist                                   | Analytics / BI      | For analytics and reporting specialists                  |
| <b>Master</b>       | Oracle Certified Master (OCM)                                            | Cross-Domain Expert | The pinnacle — rare and highly valued globally           |

CH.

A

## Appendix — Master Glossary & Field Reference

*Complete Oracle ERP Terminology with Fusion vs EBS Context*

### A.1 Master Glossary

#### ◆ BOTH PLATFORMS

| Term         | Full Name                                             | Platform | Definition                                                                                                          |
|--------------|-------------------------------------------------------|----------|---------------------------------------------------------------------------------------------------------------------|
| <b>4 C's</b> | CoA, Calendar, Currency, Convention                   | FUSION   | The four mandatory attributes defining an Oracle Fusion Primary Ledger — the Global Accounting Engine foundation.   |
| <b>ADFDi</b> | Application Development Framework Desktop Integration | FUSION   | Excel-based tool for spreadsheet-driven data entry into Oracle Fusion. Complementary to FBDI.                       |
| <b>AME</b>   | Approval Management Engine                            | EBS      | Rule-based workflow approval engine for PO, Invoice, and Expense approval routing.                                  |
| <b>ATP</b>   | Available to Promise                                  | FUSION   | Real-time inventory commitment engine — determines promised delivery date feasibility.                              |
| <b>BIP</b>   | Business Intelligence Publisher                       | BOTH     | Pixel-perfect document reporting. PDF, Excel, RTF output from SQL data models. EBS: XML Publisher.                  |
| <b>BU</b>    | Business Unit                                         | FUSION   | Primary Fusion operational entity. Decoupled from Ledger — enables SSC model. EBS equiv: Operating Unit (OU).       |
| <b>CoA</b>   | Chart of Accounts                                     | BOTH     | Multi-segment financial account taxonomy. Fusion: Flexfield KFF. EBS: Fixed KFF segments.                           |
| <b>CRP</b>   | Conference Room Pilot                                 | BOTH     | Structured functional testing session in OUM Elaboration phase — primary Fit-Gap validation mechanism.              |
| <b>CVR</b>   | Cross-Validation Rule                                 | BOTH     | Constraint enforcing valid segment combinations in CoA. Prevents miscoding at transaction entry.                    |
| <b>FBDI</b>  | File-Based Data Import                                | FUSION   | Fusion's primary bulk data loading — CSV templates via UCM. No direct DB access. EBS: SQL*Loader / Open Interfaces. |
| <b>FSM</b>   | Functional Setup Manager                              | FUSION   | Fusion's unified configuration management workbench. EBS: Fragmented module-specific setup forms.                   |

|             |                                             |        |                                                                                                                              |
|-------------|---------------------------------------------|--------|------------------------------------------------------------------------------------------------------------------------------|
| <b>GRIR</b> | Goods Receipt / Invoice Receipt             | BOTH   | Accrual clearing account from goods receipt until invoice matched and approved for payment.                                  |
| <b>IFRS</b> | International Financial Reporting Standards | BOTH   | Global accounting convention. Mandatory: UAE, EU, KSA, India. Prohibits LIFO. Governed by IASB.                              |
| <b>JERS</b> | Journal Entry Rule Set                      | FUSION | SLA component assembling JLTs and Account Derivation Rules into complete accounting prescription per event.                  |
| <b>KFF</b>  | Key Flexfield                               | BOTH   | Configurable multi-segment identifier structure. CoA is a KFF. Both platforms use KFFs — Fusion more flexibly.               |
| <b>LE</b>   | Legal Entity                                | BOTH   | Legally incorporated entity. Owns assets, files taxes, produces statutory reports.                                           |
| <b>O2C</b>  | Order to Cash                               | BOTH   | End-to-end process: Sales Order → Fulfillment → Invoice → Cash Collection.                                                   |
| <b>OAC</b>  | Oracle Analytics Cloud                      | FUSION | Enterprise BI + ML platform. Connects to Fusion, DW, legacy. EBS: Required separate OBIEE server.                            |
| <b>OIC</b>  | Oracle Integration Cloud                    | FUSION | Cloud-native iPaaS. 200+ adapters. Visual flow designer. EBS: Oracle SOA Suite / OSB (on-premise).                           |
| <b>OTBI</b> | Oracle Transactional Business Intelligence  | FUSION | Real-time self-service reporting via Subject Areas. EBS: Discoverer / OBIEE (separate installation).                         |
| <b>OUM</b>  | Oracle Unified Method                       | BOTH   | Oracle's official project implementation methodology. Five phases: Inception through Production.                             |
| <b>P2P</b>  | Procure to Pay                              | BOTH   | End-to-end procurement process: Requisition → PO → Receipt → Invoice → Payment.                                              |
| <b>RBAC</b> | Role-Based Access Control                   | FUSION | Fusion's 4-tier security: Job Role → Duty Role → Privilege → Data Role. EBS: Responsibility-based.                           |
| <b>RDS</b>  | Reference Data Set                          | FUSION | Data sharing container for multiple BUs. No EBS equivalent — unique to Fusion Cloud architecture.                            |
| <b>SLA</b>  | Subledger Accounting                        | FUSION | Configurable accounting engine translating SCM events to GL entries. EBS: Limited SLA — rules partially hardcoded.           |
| <b>SoD</b>  | Segregation of Duties                       | BOTH   | Internal control preventing one individual from controlling an entire process. Fusion: Native detection. EBS: Requires AACC. |
| <b>SSC</b>  | Shared Service Center                       | FUSION | Operational model enabled by Fusion's BU architecture. One team processes transactions for multiple LEs.                     |

|     |                              |        |                                                                              |
|-----|------------------------------|--------|------------------------------------------------------------------------------|
| UCM | Universal Content Management | FUSION | Oracle's document management repository. Staging area for FBDI file uploads. |

## A.2 Day-One Consultant Discovery Checklist

### ◆ BOTH PLATFORMS

The following questions must be answered before any Oracle Fusion design or configuration activity begins. The absence of a clear answer to any of these questions indicates a gap that must be resolved before proceeding:

### Enterprise & Legal Structure

- How many distinct Legal Entities within scope? In which jurisdictions incorporated?
- What is the corporate group structure — wholly-owned subsidiaries vs. joint ventures?
- Are there intercompany transactions requiring automated elimination in consolidated reporting?
- Foreign currency operations — multi-currency ledger configuration in scope?

### Financial & Accounting Configuration

- What is the Functional Currency for each Legal Entity?
- What Accounting Convention (IFRS, US GAAP, Local GAAP)? Are dual-reporting requirements in scope?
- Fiscal Year structure — calendar year, April-March, retail 4-4-5?
- Is the existing Chart of Accounts being migrated or redesigned? Who owns CoA governance?

### SCM & Operations

- How many Inventory Organizations (physical warehouses, manufacturing plants) are in scope?
- What Costing Method is used — or required — for each Inventory Organization?
- Are inter-organization transfers between Legal Entities in scope? Transfer pricing implications?
- What third-party systems (WMS, TMS, CRM, Legacy ERP) require integration with Oracle Fusion?

### Data Migration

- What is the current ERP / legacy system landscape? Expected data volume per migration domain?
- When was data last audited for quality? Is a data quality baseline report available?
- Who are the designated Data Owners — accountable for data quality and sign-off?
- What is the agreed Open Transaction strategy — Open POs, Open Invoices, On-Hand inventory?

## Project & Change Management

- What is the target Go-Live date? Formally approved by the business (not just IT)?
  - Big Bang deployment (all modules) or Phased (modules sequentially)?
  - Who are the designated Super Users in each business unit? Formally identified and committed?
  - What is the Change Management budget as a percentage of total implementation budget?
- 

## Oracle Fusion Cloud ERP — The Definitive Reference Manual

Version 4.0 | Senior Solution Architect Edition | Enhanced with Diagrams

★ Fusion Cloud Focus | ➤ EBS Comparisons Included

*"The mark of a truly excellent implementation is not that it went live — it is that, years later, the business cannot imagine operating without it."*
